r> Can anyone tell me where I can get a decent archiver with Gem shell
r> for each of these file types.

IMHO you would be better getting the TOS versions of these archivers, and
using 2in1 as a universal shell for all your archivers.

micros.hensa.ac.uk/micros/atari/tos/m/m060
ZOO archiver 2.1 file compression and archiving tool
micros.hensa.ac.uk/micros/atari/tos/m/m061
ARC archiver 6.02. Now handles directories sensibly
micros.hensa.ac.uk/micros/atari/tos/n/n140
TWO-IN-ONE 1.51e Shell for use with many archivers

Of get DC XTRACT which is an all in one archiver capable of extracting
arc/lzh/zoo/zip without you having to use separate programs.

micros.hensa.ac.uk/micros/atari/tos/o/o111
DC XTRACT 2.20c 4-in-1 archiver/dearchiver.arc/lzh/zoo/zip

Just to let you know, I got the latest (1.17b?) version of CAB/STiK from the Yolo Atari Club at the recent SAC Expo. And so far, it is working MUCH better than 1.16. I have had 3 hour sessions without so much as a single runtime error! Sure, it has crashed a few times, but all in all, it's become a much more stable and reliable program.

In case anyone is wondering, I am running it on a 14 meg Falcon with a Supra 28.8 modem in 256 colors using BlowUp (software version) to increase my resolution. It looks nice...

Also, though I haven't uploaded it anywhere yet, I will probably put it up on Toad's FTP site soon. Unless it is already available elsewhere? Let me know if anyone wants me to put it on Toad.

Date: 1996-04-01 00:00:00 UTC
From: daveb@mbha.demon.co.uk
Message-ID: <828484042_OASIS_@mbha.demon.co.uk>
Source record: 147916

Hmmm, can't remember the name. ACCstuffer or something similar.

Codeheads or someone released an accessory some years ago which allowed
the use of up to 32 accessories. I read in a recent edition of Atari World
(RIP), that it had been updated, and I am hoping it will run on the TT
under MagiC.

Can't find it. Can anyone help?

Alternatively, are there any patches/hacks for MagiC/Ease which allow
the use of more than 6 desk accessories?

All help gratefully received...

What sort of things are people looking for in an astronomy program?

I'm new to ST programming and thought I might cut my teeth on a few
astro. programs. I have my own ideas about what I want to get out of
them but it'd help to know what other people need should I ever think
the stuff is worth making public.

I suppose the basics are:

o Positional calcs. for stars and planets

o Plotting star charts and sky views

o Catalogues of standards (photometric,spectroscopic,etc)

o Observers timetable/scheduling (zenith distances etc)

o kewl pictures ripped off various NASA archives...

o ???

One of my favourite PC astro. progs. is called 'Dance of the planets'
if I can get anything near as good as this I'll let you know!

Andrew.

a> has used one would tell me if they are any good? Is it worth fixing?

That would be the CX-80 trackball. You need a new cable, a soldering iron, and some chutzpah. You have to bypass the edge connector that's built-in (pop off the rubber feet and open the case to see what I mean) and connect XA, XB, YA, and YB to the pins of the chip in the bottom right corner of the PC board. Ground is obvious, and the left and right buttons should be also. There's a jumper on the PC board between the 2 buttons that must be removed; also you have to find out where to connect +5v (but it's the same place as originally, so that's not too difficult if you have a voltmeter).

I have made several of these old trackballs into replacement mice - they're practically indestructible (important if you have kids) and convenient if your deskspace is limited.

Yes it was, but didn't do so well... at least not compared to it's initial release on the ST/Amiga platforms.

The company which wrote it, Software Heaven, still exists, and operates in San Diego.

>Can any one tell me how to set up Nosshell. I did what it said in the
>very tiny Readme file but after I've logged on with stik I run Oasis
>and then log on with that to the Internet but nothing seems to happen.

You may already have an answer to this question by the time you read this but
you don't run Stik with Oasis. AtariNOS provides your connection to the
internet and is run by Oasis when you say connect to the internet. When all
transfers have been handled by NOS you press your F9 Key which drops the
connection and type exit at the NET> prompt to go back to Oasis.

Be sure to use the install program to configure your Oasis before you run it and
you may even need a text editor to edit the dial.txt, startup.nos, active.dat,
and nntp.dat files.

I will post a text article on installing Oasis to this newsgroup soon.

20. Any Screen Savers available?

Newsgroup: comp.sys.atari.st
Date: 1996-04-01 00:00:00 UTC
From: csh@falcon.sdi.agate.net
Message-ID: <828418814_OASIS_@falcon.sdi.agate.net>
Source record: 147987
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Are there any decent screen savers out there? The demo version of Twilight looked really cool, but I've never heard of a commercial version. Does it/Did it ever exist?

And I read somewhere about an English version of Before Dawn...but all I can find is the German version. Was an English one ever released?

I used to use the Warp 9 EOS, but now that I have NVDI, I don't use Warp9, and I need a screen saver (that's Falcon compatible). Any suggestions?

Thanks in advance

>Any serious reactions will be greatly appreciated!

Hi Sander

I started using Superbase Professional to do invoicing on, then
switched to Atari Works. If your business isn't too big, you can use
any spreadsheet to build a synoptic journal.

If you want something fancier, I would consider (sigh) another
platform.

I tried ST Accounts - crashed my partition
DAC Easy Accounting - works okay on ST, but the Falcon didn't like it.
I ended up with B.E.S.T. Accounting Version 2.0. It's not a bad
package, but lacks some serious bells and whistles. For instance, you
can't print reports to the screen in Version 2 (you can in version 3).
It seems to be very complete, but it's also a double entry accounting
system, something most new accounting programs do automatically, but
in B.E.S.T. if you debit one account you have to credit another. Still
it is a serious package. I got mine used for $25.

As long as the program you use can print the paperwork your accountant
wants to see, he/she will be happy, although they're likely to wince
if you say ATARI.

I ended up going to Quickbooks on another platform. It's the business
version of Quicken. The package advertises it as being for people who
want to be in business and not be accountants. That's exactly what it
is. Very easy to use. Very powerful.

Back to the synoptic journal, a good accounting book can probably clue
you in on how to do one of these. Been meaning to key one into AW
because they seem so neat, but haven't had the time yet.

Good luck
Tom

23. Spectre Mac and Quark

>to buy the package from HiSoft? :(

Never tried it myself but unless a *lot* if people have been telling
porkies in these newsgroups then there is a cab.ovl for Mint.

Cab itself does nothing with the internet connection. It invokes
cab.ovl which is responsible for supplying the files Cab requests. As
there is a cab.ovl for Mint and as Mint supports PPP then the problem
is solved - except where to get it, which I don't know. However, if
you post something asking where it is then I'm sure many people can
help you.

I do know that Mint is on plenty of ftp sites. The Mint cab.ovl will
probably be there as well. The only thing it should cost you is time
'cos you have to read a lot of docs to get Mint setup right.

If you do choose to do it though, you will have a pretty powerful
internet setup.

> + VAT !!!, I know this doesn't include casing, but that is relatively
> cheap. On this score, your drive should be priced around 50quid !!!!
> And thats comparing it to a brand new drive !

I think this is a little unfair.

Okay 270+VAT = 317ukp. However a case and SCSI2 cable is going to add at
least 50ukp+15ukp+VAT (76ukp) to this. So aparently you can buy a 2Gb drive
config for 393ukp. This is nearly 4 times the asking price and if you
haven't got 393ukp then 100ukp for a 270Mb drive isn't all that bad.

Also quite how do you get 270+VAT for a 2Gb SCSI drive? An EIDE one might
be in that price range - but SCSI ones are 400-500ukp +VAT. This makes the
price of a 2Gb config 546ukp ie nearly 5.5 times more expensive than what
this guy is asking for a slightly 2nd hand 270Mb config!

Offering 50quid would just be taking the mick.

Roland.

26. Atari Trackball, are they any good??

Newsgroup: comp.sys.atari.st
Date: 1996-04-01 00:00:00 UTC
From: ac125@ccn.cs.dal.ca
Message-ID: <4jnaio$94m@apollo.isisnet.com>
Source record: 147993

I just bought a trackball in a fleamarket. It has a switch on the back to switch between trackball and joystick. The ball is a large heavy and black, about the size of a billiard or pool ball.

The unit only seems to work as a joystick and not as a trackball mouse which is what I actually wanted it for. Before I spend ages pulling it apart to try to fix it I would appreciate it if someone who has one or has used one would tell me if they are any good? Is it worth fixing?

Thanks to anyone who can help!

Hi. I have a network system using the MIDI ports for sale.
Includes hardware for 2 nodes by SGS, and the software by
A & D(latest - v1.2). Connect any two Ataris together and
share hard drives and printers.

The new price for the software is $149US alone
plus the cost of the hardware, at least $60US(total $209US+)
In summary, it would cost $335Cdn NEW to import into Canada.
Please email an offer plus shipping if interested. Thanks.

well straight off i admit i own an amiga, and i think that it beats the
hell out of st's however i am interested in knowing a bit about the
falcon.......specs...where you get games, who supports it (softies,
hardware manufacturers).....i know nothing about this machine....how much
do they run....do they come with harddrives standard??
i thought atari had dropped it personal computer line....i used to own a
130xe some years back....
novakra@acasun.eckerd.edu

The Falcon computer is a great Machine. If you are into video
check Apex Media animator and Expose True Color Digitiser. I have
seen FLH/FLC video played from the Falcon on a TV and looks like
TV Broadcast. also it is able to do at the same time 50kHz stereo
audio!

You can find technical specs, prices and software also demo of
apex media on

The AtariST/falcon Yellow Pages at:

35. SOFT PC for Falcon

Newsgroup: comp.sys.atari.st
Date: 1996-04-01 00:00:00 UTC
From: afn14016@freenet.ufl.edu
Message-ID: <4jnrh8$c9s@huron.eel.ufl.edu>
Source record: 148002

A friend on the internet has a program for the Falcon called softPC.
He realy has tried to get in touch with me but his server has problems.
I wonder if this program is PD or Shareware and how can I get it.

I can believe that only two people on the net have softPC falcon!

can any one post this on an FTP site if it is possible?

I heard that it can run windows and it is faster that PC Ditto.
OK I know, Ditto was really slow but I would like to get
Soft PC anyways.

Would any one send it to me or if shareware post it to the
Toad Computer site at:

ftp://ftp.toad.net/incoming

I think it will be of help to all Falcon users.

If not please tell me where can I buy it. Thanks, Raymond

36. Calamus SL - Accuracy Problems and Question of the Bridge Mod.

From: smiller@farad.elee.calpoly.edu
Message-ID: <4jnsvl$k4s@isnews.csc.calpoly.edu>
Source record: 148003

hello, I have the latest version of Calamus SL from August of 1995 and I have found that the crop marks ARE NOT ACCURATE. I am using SL on a TT with TOS 3.06, 2 megs ST ram, 16 megs TT ram and outputting to a SLM 605 printer. I am going to buy a 600 dpi HP printer, but I don't want to if the registration and dimensions of the output are not accurate. I found out that they were not accurate by measurig them with an engineering scale...

Also,

Is anyone using the bridge module for output to postscript? I am publishing a 100 page magazine that will soon need flim output for the printer who is printing the final copy and I need to know whether or not the bridge module works correctly or not...

Please let me know soon!

Strange. As you said the size of the Minix partition is 100 MByte, I see nothing unusual with this
configuration. Maybe there is something wrong concerning your configuration of MiNT? Did you
provide for the Minix XFS driver to be started?

> The HD Driver version I received is 4.52 which I gather is already

134 == 128 + 6

SIGABRT == 6

When a program crashes due to a signal the shell adds 128 to the
signal number and uses that as the exit code in $?.

42. FS (US): 120meg SCSI HD - $22 each + shipping

Newsgroup: comp.sys.atari.st
Date: 1996-04-01 00:00:00 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <h5Ool51.lmcclure@delphi.com>
Source record: 148009

I ran across the following deal on 120 megabyte SCSI drives that I
thought fellow Atarians might be interested in.
-
Please note that this represents no endorsement, other than the fact
that I have ordered one of the drives:

==========

Conner CP30100:

The drives are technically 1/3 Height 3.5" drives

HxLxW = 1.00" x 5.75" x 4.00", weight 1.3 lbs, power < 4w
SPECIFICATIONS:
Formatted Capacity (MB=1,000,000)_____121.7
Cylinders_____1522
Sectors_____ 39
Heads_____ 4
Disks_____ 2
Blocks_____237,705
Buffer Size_____64KB, segmented

Average Seek_____19ms
Single Track_____8ms
Rotation Speed/Avg. Latency_____3400 rpm / 8.8
Transfer Rate to/from media_____1.5MB/sec
Transfer Rate to/from buffer_____4.0MB/sec

Conner CP3100:

Similar to above except:

Format Capacity 104.5 MB
Dimensions H x L x W x Weight: 1.625" x 5.75" x 4.00" x 2 lbs
Track-Track Access 8ms
32K Buffer
Data transfer rate: 1.66MB/Sec

For larger orders, we may include a couple of cp3100 drives

Drives are available, and $22.00 each.

Please send check to:

M. Hatzakis
51-8 Revere Rd
Drexel Hill, PA 19026

Please enclose $6.75 for postage. There may be some delay in shipping
drives by the time it takes us to pack and ship.

>Why not? Isn't part of the advertising ahead of release supposed to
>achieve this effect? Given that there's still no web browser in the
>package, I'd like to know what exactly it is that's going to have me
>drooling so much that I want to pay £30 for an enhanced version of what
>I'm already happity using.

I for one am happy with the nos/oasis combo as it is apart from a few
little things.. no irc client no vt emulation in telnet and no web
browser. Apart from the irc client oasis 2 should solve these for me
if what Phil tells me is true :)

>We've all heard a lot of hot air talked about this, now how about some
>hard facts. Personally I think the thing most people will be heartily
>disappointed with will be the lack of web browser integrated into the
>package. We've been told it's coming soon for a very long time and I for
>one don't want to carry on being fobbed off with that.

I cant see this being a big problem really it will be included
eventually. They are just doing things the other way around to
stik/cab which had a web browser and irc client first then people
started work on the other main clients.
They have said that the web browser would be coming soon for quite a
while now.. but that depends on your definition of soon :>

>Meantime there's a danger of being second in the race to CAB/STiK and the
>assorted modules which already provide ftp, telnet, IRC, weather, and the
>imminent e-mail. Can't be long before STiK supports PPP as well now. Is
>that why we keep getting these kind of postings? Try the truth and let us
>make our own minds up. If it's so great why isn't it out yet? What
>problems are you having with the betas?

I think there is enough room for both packages really.. I for one can
see me using both packages now and again and swaping between them like
I do with stik-nos/oasis at the moment oasis 2/ice will have 1
advantage though that you can run more than 1 client on a single
tasking system at once just like nos.. whilst with stik you would need
magic/geneva/mint to do the same thing.
What stik has in its favour is the open development of client programs
to use it, If somebody wants to write a program which uses tcp/ip they
dont have to write it all again they can contact one of us and get the
development docs/includes etc and just access stik.

>Please give us one thing or another, not endless carrots on strings. If we
>were donkeys more of us would be using PCs :-)

I would definately like to see a list of features which will be in the
first released version. Not what will be in eventually but what will
hopefully be in the release version.

Flinny.

BTW www130 soon (sorry had to do it:>)

I guess you mean a SLIP or PPP link??? In either case look for something called Oasis (should be on micros.hensa.ac.uk, src.doc.ic.ac.uk, etc.). If your mailbox is using POP3 then you should also track down POP_NOS3 and use it instead of the version of NOS which comes in the Oasis package.

It's up to version 2.something right now. It operates ok, but it is not a speed demon. You have to keep the video window downsized to gain speed of around 5-6 fps (frames per second) as I recall. I have tried an earlier version, looks very promising.

The GTLOOK II scanner software is expensive ($175?) but drives the EPSON
line of flatbed scanners. Uses SCSI interface, so for ST/STe line you may
need a LINK I or II.

For further details I suggest you email Dave Troy at TOAD COMPUTERS
(dave@toad.net).

It is on the POWER CD put out by Compu available from TOAD or "Systems
for Tomorrow". I tried it on my mega and it needs more that 4 Megs to run.

59. Forms in CAB 1.0

Newsgroup: comp.sys.atari.st
Date: 1996-04-01 00:00:00 UTC
From: dhend@rmplc.co.uk
Message-ID: <828474282_OASIS_@rmplc.co.uk>
Source record: 148026

Hi all,

Despite CAB's claim to now support forms (there's even one in the demo
HTML file) I am unable to get it to work properly.

The problem:
Although one liner forms work fine (search engines et al)
anything with more than one place to enter data, or a menu or something
(eg: futurenet registration form/extended searches) fails to be sent.

It seems only a blank form is transmitted.
Any ideas??

Yours etc.

David.

SIPPs have a row of bendable leads on them. The Stacy laptop model uses
this package style of memory.

SIMMs are also modular memory units, but the contacts are part of the
board, just like a cartridge for the side of the STe.

With SIMMs, you don't have the problem of bending leads by accident.

Very few computers use SIPPs. (STacy is an exception.)

First off, ftp.toad.net does not regularly check their incoming directory. To get something onto Toad's ftp site so that others can actually download it (people can't download from their incoming directory), you should upload to the umich site which is mirrored by Toad.

Anyhow, uploading to an ftp site is a relatively simple task. If you're using a unix shell account, upload your file to the unix box using rz (as you said you were able to do). Then you can "put" the file on an ftp site just like that: "put [filename]". It's the opposite of "get". All of this is streamlined and user-friendly if you use a graphic-interface ftp program.

Have fun...

>I'm already happity using.

Since you are a registered user of v1.35 (you are of course aren't
you?) the cost is expected to be £20 to upgrade to v2.xx. As stated in
register.txt Oasis has been shareware since v1.34 and you are "already
happity using"

>We've all heard a lot of hot air talked about this, now how about some
>hard facts. Personally I think the thing most people will be heartily
>disappointed with will be the lack of web browser integrated into the
>package. We've been told it's coming soon for a very long time and I for
>one don't want to carry on being fobbed off with that.

Spider will not be ready in time for the release of Oasis2 and will be
released as an add on package later. :(

>What problems are you having with the betas?

Surely thats the whole point of betas, as many pre release
incompatibilities are being ironed out in private. Dave is, as we
speak, checking Magic4 and the FX card to maximise hi-end Falcon
compatibility. These were unavailible at the start of beta testing and
would have created a storm of bad publicity for this fine prg should betas
have been freely available.

>Please give us one thing or another, not endless carrots on strings. If we
>were donkeys more of us would be using PCs :-)

Unfortunately only too many of us are using unregistered shareware.

I have heard how many of us have registered www1.xx with Joe or Danny.
It was chosen to release it this way due in part to its multi national
origins and has that freedom as part of its ethos. Oasis 1 was freely
usable until very recently and even now has only a nag screen and

delay to nudge you gently to part with your money. But this is two
local guys investing vast tracts of time in a program that will never
make them rich however much they deserve it. (even if we all register!)

I agree though, Dont be a Donkey, register :)

OK get out the plastic bag
Tie firmly over the keyboard
Here goes

OASIS 2
folder full of folders for a tidier system

UUCODE for auto uudecoded usenet
WWW to take spyder files
OUTGOING
INCOMING
MAIL
NEWS all self explanatory?
SYSTEM for all other files

all thats left are the executables
Ice net configuration program for oasis setup
oasis2
oasis editor (improved)
ice
Low mem prg for those of us RAM challenged.

Oasis (offliner)runs under any tos, magic, rep\desktops
conversion utilities to change news yellow pages etc to new format
yellow pages now supports long email addresses
visually very similar to v1
Uses Speedo\nvdi fonts
graphical representation\selection of news tree threads
completely revamped news filling\unbatch
built in uucode\decode
provision to hook in PGP
select group to be downloaded as headers for later retrieval
up to 10 accounts and internet service providers
sep sigs for mail or news
toolbox to integrate other prgs ie everest pgp zip lzh etc
auto code\decode of binary mail\news single or multi part
batch FTP
search modes for current docs
choice of window and text colours
choice of display font (Speedo\NVDI3+)
sysop\ user access censorship
easy reset last read pointers (backdate to pull in recent messages to
new group)
online help via ST Guide
Hold, kill, activate ,edit items(mail+news) prior to uploading

Neat huh?

But then this is the killer

ICE (Internet Connection Extension)no more NOS
Fully GEMed
Magic compliant
all functions available via menu entry,shortcut or cli
Directory window views either local or remote system for FTP
Multi windows for mail, news, sockets,FTP, viewer for ping finger etc
Change news server on the fly
Lookup address (access DNS)
Auto logon to FTP sites via hotlist to pre determined directory
Fonts + colours as in O2 above
send news via "I Have" or "post" protocol
download news via date lastread or article no.
pasword protected FTP from selected directory
(your machine can be used as FTP site!)
POP3 support
dynamic adressing of news\mail servers
online clock displayed in the menu bar
recieve\send modem lights displayed in menu bar
multiple packet system now supported eg cix

Now this little lot is not all!
But as a simpleton I can't even guess at the (as yet) undocumented
features
But here's a hint
ICE menu bar also has headings telnet and talker
I'm sure someone more knowledgeable will step in here

suffice it to say
get those cheque books out.

Enough info Andrew?

Actually, any ftp'd file can be saved to a double density (720KB) disk, and
therefore be read and uncompressed on the 1040.
Start off with the uncompression software (STzip, ARC, lzh, etc)
may be a problem if he doesn't have a hard drive as everything will have to be
done on a floppy, and/or RAM disk.
good luck.bonne chance

I only use my Falcon for business and education (no games at all).
I use dBMan for databases, which makes dBase III compatible files, for
those with EXCEL on PCs - they can use these files directly.

LDW Power is a spreadsheet which is capable of transforming the data to
1-2-3 compatible files.

I use Calamus SL for most of my DTP work. That company makes a version
(CALAMUS NT) for WIndows NT. Also I can transform the documents to TIFF
or Postscript to share them with other systems.

Hope this helps you. The only reason I have a Pentium at work is because
of the corporate trend with Microsoft products. Didn't stop me from
putting Gemulator in it and being more productive than most.

If you are that interested then I've taken a screen shots of the
system and have posted then out in the FAN N.COMMS.UUCP file echo, or
they can be freq'ed from me (once the system is back up) as
OASIS2PX.ZIP.

It details how the ftp server works and shows off Oasis and Ice.

Just to let everyone know node 90:90/0 is now back up and operational.

The downtime yesterday was indeed due to the power supply (a capacitor in fact) dying and so no power was getting through to the Mega ST4.

The Mega ST4 is now piggy backed on top of an old DEC Alpha (with no top on) which is supplying the power to the system.

It looks a lot like a derelict spacecraft, but at least we're up and running for mail once more.

In the last few days/weeks a number of people have been making various
comments and statements both in the News groups and in E-Mails to
myself and Dave regarding OASIS2 and ICE.
I have responded to a few of these statements, but as we feel that we
are very close to releasing both programs here is a fairly detailed
list of changes made to OASIS and a few comments abount ICE.

OASIS 2 New Features

PGP encrytion/signing and decryption/signature check direct from
inside OASIS.

Extract single or multi-part UUcoded News and Mail items directly
from the Daily Net and Post Box.

Send UUcoded News and Mail items, single or multi-part, directly
from inside OASIS.

Select articles for downloading from list of available articles.

Select News articles for viewing from a graphic 'tree' linking
articles by there reference to each other.

Individual News groups can be controlled in a number of ways. Each News group's last download date or article number can be edited, News group can be controlled by the Main User or any of the Multi Users, groups can be set to download articles or headers allowing you to select only the articles you want and News groups can be censored to deny Multi Users access.

Seperate signature files for News and Mail.

CC copies of Mail items can now be sent.

Support for multiple Internet accounts.

Incoming Mail for unknown Users can now be directed to selected Mailboxes.

Find and Repeat Find for text in any window.

Batch FTP mail items created from list of items selected while on-line.

Enhancements to existing items in OASIS 2.

Select multiple items in windows.

'Proper' GEM vertical and Horizontal sliders, size and full boxes on windows.

News and Mail headers now comply to relevant RFCs, including In-Reply-To', 'Reference' and 'Organization'!

Internet window now shows the details of who a Mail item is for and it's Subject, for an News item the News group and Subject are shown.

Support of scaleable fonts with NVDI and Speedo Gdos, select fill colour for window.

Extract and Print selected text from a News or Mail item.

Dialogs in windows for better support of Magic.

Yellow Pages now sorted by Surname and then Christian name.

E-Mail size in Yellow Pages extended to 120 charaters.

Outmail now shows the name of the E-Mail recipient.

In addition to these improvements many sections of OASIS have been completely re-written to improve speed and reliability.

The major new part of the OASIS package is ICE.

ICE is a complete replacement for NOS, that is totally GEM based with windows, menus and dialogs. All actions in ICE can be performed using either the mouse or from a window based command line, access to Desk

Accessories is not possible. ICE runs under Magic and can be left downloading News and Mail in the background while you run another application.

ICE currently gives full access to the Internet for SMTP and POP3 Mail, NNTP News, FTP (both for access and as your own Server), Finger and PING. ICE supports the SLIP and PPP protocols.

People may critisise me for this statement but ICE has to be seen to be believed!

ICE takes all its paarameters for Dial script, Modem commands, IP addresses, TCP/IP details etc for upto ten different Internet accounts from a single text file. However to ease configuration, a single point and click program can be used to edit all the parameters in the configuration file.

We will be releasing OASIS2 and ICE before the end of April, ideally we would like this to happen over the Easter weekend.

I hope these comments answer peoples questions about OASIS2 and ICE, if you still have any unaswered questions, please feel free to ask.

72. Re: Anyone notified on their purchases through the Atari Warehouse sale?

Newsgroup: comp.sys.atari.st
Date: 1996-04-01 00:00:00 UTC
From: fl@io.org
Message-ID: <4jpkd1$ie@news1.io.org>
Source record: 148039

I placed an order for one of the TTs by email, although I had to try sending the message several times as the mailbox was, well, full (No Kidding!) This was last Friday the 29th.

Not knowing who Don Thomas was, I called the 1-800-go atari number for some sort of confirmation that this was not a scam. The gentleman who answered was kinda gruff and said "didn't the post say NO PHONE CALLS?!!?" Well, yes, I said, but explained that I wasn't phoning to place an order, but just to establish the validity of the post, which I guess he had just done.

At about 5:00 PM EST I received a call from a woman who identified herself only as Atari Corp. and wanted my credit card number (which I had stated in my post to them that I would only provide over the phone) which I happily provided (sorta like winning the lottery, in a way).

So now all I have to do is sit back and wait for a couple of weeks to get my new, er, used machine.

So now come the flood of inevitable questions. These TTs have 2 megs of ST ram and 4 megs of TT ram. Is the ST ram upgradeable to 4 megs (or more)? Is it SIMMs or is it surface mounted like in the ST? Does all this depend on the version of the motherboard in the particular machine?

Two megs of RAM seems like an odd number (isn't it usually 1 or 4, or multiples of 4?). Is the TT ram the same story?

Will I be able to use my old SM 124 monitor with the new machine until I get the wherewithall together for a new VGA monitor?

Thanks and Sorry to all who tried to get in and didn't make it. I don't mean to post here to gloat, and any introductory info on TT ownership some kind soul can provide will be sincerely appreciated.

Since last July I have been waiting for the Afterburner 040
accelerator for the Falcon to become available in the UK. Gasteiner
were distributing it and then it suddenly switched to Compo.

From what I have read else where on c.s.a.st Compo are no more so I]
was wondering if anyone knows if someone else will distribute it in
the UK.
I have not contacted Compo at all, they probably have enough to worry
about without me bothering them

Rich.

There is no "Good Times" virus! The whole thing is a hoax. In fact, shortly after ST Format reported the virus someone wrote in saying that the whole thing was a fluke. Even the college lab I used had these warnings, but it's all false. File this under chain letters and modem taxes(veterns know what I mean). If even the FCC believes this crock, then imagine if they actually try to "regulate" something they know little about :)

No.

You've got the right idea, but I think you have made a little mistake.

The Good Times virus only attacks hoaxes.

The IBM and Mac are the hoaxes.

Unfortunately noone has caught on yet to the joke...

Source record: 148052

Although the following is primarily a problem for Intel users, there may be variants that prefer Motorola flavors...
-v- (from PC & Garden Magazine April issue)

Silicamite Warning
==========

Once again spring approaches, though one may be forgiven for doubting this considering the state of the weather. Unfortunately, with spring comes also an increase in the pests which plague our life. Just a glance in the budding garden will show the advance troops of the coming attack creeping around looking for food, i.e. the first delicate buds.

Even indoors, there is a marked increase in the insect population. One of the more insiduous pests these days is the little known Silicamite, which is rarely seen itself, being a burrowing species, but sadly the circumstancial evidence is all too plain. For the unfortunate, moving the PC or laptop reveals a fine sand dusting the desk. If done carefully, the sand is found deposited in miniscule neat cones directly below where the ventilation holes were. Most often however, the movement and displaced air will spread the incriminating sand over a larger area making it hard to detect and distinguish from your usual urban grit and dust.

Please note that Silicamites are a very different and much more serious problem
than the "screen mites" most people associate to when they hear about this.

The tragedy of Silicamite infestation is that the mites burrow in the plastic and silicon material of the PC's microchips, and substantial colonies can infest the CPU and similar larger VLSI chips, before the invasion is detected (if at all), making it virtually impossible to salvage the PC.

Apart from the physical residue sowing infestation, what are the symptoms?

Commonly, the first symptom noticed is that the PC starts acting strangely, with inexplicable program crashes and general strange behavior. A mite-infested MMU fore example usually gives frequent sharing violations. As an aside, it has been surmised that the infamous Pentium arithmetic errors were due to the entire Intel production line having been infested by Silicamites, but so far Intel has declined to comment. Sources close to the plant do suggest however that workers were seen after-hours shovelling and vacuuming in the clean-room.

Later stages of the attack cause more significant problems, such as system hangs, restarts, screen anomolies, and even total failure; all depending on the extent and spread of the infestation. Silicamites grow and reproduce fairly slowly, so it can take years from initial burrowing to the final stages.

Assuming that one's PC is infested with Silicamites, what can be done?

Very little actually. Isolation of the infested PC to keep the problem from spreading is an obvious measure, although in all likelyhood, by the time the problem is noticed, it is already too late. Piles of fresh VSLI chips kept at about 30 C (whether the chips are functional or not doesn't matter) laid around the PC nightly might give an extended operational life by inducing at least some of the Silicamites to migrate out of the PC. The risk is of course that these chips might already be infested, which would aggrevate the problem by causing migration to the PC instead.

Readers are invited to write and share their experiences and I will take up a Q&A column with the most relevant topics in the next issue.

Info about the Jaguar Server.

Current hardware revision B.
BootROM B001, JagOS version 1.06.

A | in front of a line means that some new stuff
has been typed in there since the last info file...

The Jaguar Server project started out in August '94. The goal
was to make a cheap developer kit for anyone that wanted to
program for the Jaguar. Atari's own developer kit was $5500 and
that was WAY to much if you just wanted to hack and program the
Jaguar just for the fun of it.

The very first prototype was built around the Mega ST's 'MegaBus'
All of it was hand wired together using a total of 21 IC's.
I can tell you that this board had VERY little empty space on it..
This prototype was soon scraped, as i begun work on the Rev A
board, using a different approach this time. It was built for the
cartridge port and could then be used on all Atari computers not
just the ones having a 'MegaBus'.
To keep the cost down, i also decided to use the Jaguar's 2MB
main memory and not include any expensive RAM chips in the Jaguar
Server hardware.

The Rev A board was up and running with very simple software in
Februari '95. As the Rev A board had some small flaws, i made

some changes to the layout and came up with the Rev B board.

More serious work now begun on the Software - The Shell running
on the Atari and the JagOS - Running on the Jaguar.

General Info.
---

* Use the Jaguar Server kit to develop Jaguar programs !

* The Jaguar Server runs on all Atari ST/STE/Falcon/TT computers.

* The hardware plugs into your computers cartridge port. From the
cartridge hardware goes a 40 pin ribbon cable into the Jaguar.

* Uses a slightly modified standard Jaguar. You send our Jaguar
to me for modification, and i'll send it back to you.

* You can change betweeen 'modified' and 'orginal' Jaguar by the
flick of a switch. A reset button is also installed.
ABSOLUTELY _NO_ compability problems with Jaguar games.

* No programing restrictions apart from a 2Mb main memory limit
in the Jaguar. Future software updates will be able to upload
data at the command of a running Jaguar program.

* You use the Jaguar Server software to upload programs/data to
the Jaguar. The software looks best in resolutions over 640*400.

* Software updates to JagOS (Jaguar Operating System) are possible
without burning a new EPROM chip.

* Upload transfer rate is currently 65 Kbyte per second on a 8 Mhz
Atari and 108 Kbyte per second running at 16 Mhz.

* Use the Devpac 3 assembler or any other code generator to write
programs.

* A remote debugger is under development.

* Software updates and info are availible on InterNet World Wide Web
at http://www-und.ida.liu.se/~t94patsa/jserver.html
and by filerequest with any FidoNet compatible mailer to
STacken BBS on FidoNet 2:204/219 under the magic name JSERVER.

| * A Jaguar Server Developer Mailing list are availible for
| programming discussions. NOT open for anyone.
| E-mail to nat@zumdick.rhein-main.de for more info

* The Jaguar Server development kit contains this...

+ Jaguar Server cartridge (hardware)
+ Jaguar Server Shell & JagOS (software)
+ Switches, ribbon cable, connectors and everything else
that you need to start programming right away.

```
+ A few Jaguar (*.JAG) programs and example source code.

* IT DOES _NOT_ CONTAIN THE FOLLOWING... You have to get these
things yourself....

- No 68000 or Atari RISC assemblers.
- No Jaguar technical documentation.

* 'Hacker' experience and good knowledge of assembler programming
is STRONGLY recommended because of lacking Jaguar technical
documentation.

* The Jaguar Server is NOT connected to Atari Corp. in ANY way.

* _Introduction_ price is :

3400 Skr
685 DM
300 GBP
465 USD for the Jaguar Server and a new Jaguar console
(Swedish PAL), modified and ready to be used
directly.

1500 Skr
300 DM
135 GBP
205 USD for the Jaguar Server and modification.
You send your Jaguar to us...

Shipping is NOT included in these prices and will be added!

-----------------------------------------------------
Some technical info.
-----------------------------------------------------
A Jaguar (*.JAG) program is built around a header. There are
currently five different headers, each with it's own use
and advantages depending on the development environment and
programs.
For example, one of the headers looks like this (for Devpac 3)

*------------------------------------------------------------*
* Standard JagOS 3 Upload & Run parameters. *
* © Roine 940420 *
*------------------------------------------------------------*
* OUTPUT i:\*.JAG * Output standard Atari Executable.

down EQU $5000 * Download adress in Jaguar.
start EQU $5000 * Program start adress in Jaguar.
OPT D- * No debugging info.

dc.b 'JAGR' * Magic to skip Devpac Header.
dc.w 3 * JagOS 3 - Recive & Run.
dc.l down * Download adress.
dc.l c_end-c_start * Lenght of Jaguar Code.
```

```
* A dc.l 0 are also possible.
dc.l start * Start adress.
ORG start * If position dependent code.

*---------------------------------------------------------------
c_start * Jaguar code start.....
NOP
NOP
ILLEGAL * Not much of a program... Hmm...
c_end * Jaguar code end.
*---------------------------------------------------------------
END
```

```
--------------------------------------------------
Jaguar Modification
--------------------------------------------------
As there has been some trouble with users installing things wrong when
modifying their Jaguars to accept the Jaguar Server Development kit,
I have decided to NOT to let users do this modification on their own
any more.

I really think that this solution is the best for both parts.
This means that the Jaguar Server Development kit will work when you
get it, just plug it in the computer and start programming and i will
get happy customers with working kits!

This means that you now _MUST_ send us your Jaguar console and i will
do this modification for you. This will ensure that the modification
is correctly done and working 100%
It is also possible to order a complete new Jaguar Console (PAL) if
you for some reason cant send your Jaguar to us.

--------------------------------------------------
Misc Info.
--------------------------------------------------
If you have more specific questions or want to order,
write me by E-Mail...

I like the idea of being a shareholder in AW ...

Is there any chance that it may be thrown open to private investors to put some
money in. I doubt you'd make much money but it would ensure AW ccomes out (and
you may get a reduced sub !)

ST Format had a couple of pages devoted to this upgrade a few issues ago.
Can't remember which one, though. The information is also available on
the net...Look for something along the lines of 38400bps.lzh at a.a.u.e.
There are other, more challenging mods out there that'll take your serial
port up to even higher speeds. RSVE comes to mind: look for rsve_1.lzh
and rsve_ge.lzh on a.a.u.e.

I have the following Atari-related items still for sale. The figures given are either what I would like to get. I have had offers for some of these items, but I'm looking for more than what I've been given.

Hardware:

Atari Falcon030, 4 meg RAM, 85 meg HD $800 OBO
(comes with Geneva and Neodesk)

Books:

Abacus books (all for $15)
Atari ST Internals
Atari ST Graphics and Sound
Atari ST Machine Language
Atari ST Tricks and Tips
Atari ST Peeks and Pokes
Atati ST GEM Programmer's Reference

The Atari compendium, $30 OBO

Software with packaging:
(Make an offer for the whole lot or for individual items. Items are grouped into the units that I would like to sell, but it's not carved in stone.)

Universal Item Selector III $15

Word Up $15

GST Macro assembler, version 1.0 $5

Orbiter $5

Lattice C, version 5.5 and 5.6 $100

Assem Pro $10
Laser C, version 2.1 $20

Just disks: (make an offer for the whole bunch)

ECO
Populous
Populous The Promised Lands
Silent service
Millennium 2.2
Sundog
Lisence to kill

Michael Jackson Moonwalker
The Real Ghostbusters
Tempest
Degas

Get ICD PRO, it doesn't require the ICD host Adaptor and will
handle the FALCON internal IDE, master and slave I believe but I'm not
sure about the slave. All of the Mail Order houses have it, $50, US.
Another one that is suppose to handle it is HDisk Utilities,
$40. I've never used this one but I've heard good things about it here.

This is the BMW of Atari floppies. LED track counter, compact, claims to step out to 880K, in like new condition, with all original packing and documentation. I'm selling it for a friend, though I wish I could keep it for myself.

$60 CDN (+shipping), or I will keep it!

I'm in Canada; the power supply is suited for North America. Buyers elsewhere will have to deal with different voltages.

101. Faster modem speeds?

Newsgroup: comp.sys.atari.st
Date: 1996-04-02 00:00:00 UTC
From: dave@mbha.demon.co.uk
Message-ID: <828553354_OASIS_@mbha.demon.co.uk>
Source record: 147868

I use a TT with hsmodem and a USR Courier running on modem2.

The best speed I can set for the port in Connect is 38400; anything faster does not dial out.

I am jealous as hell reading some guys getting 6000cps. the best I can do on a BBS is about 3500.

Is there any setting I can use to get more? anyone know why I cannot set the port speed for 57600?

All suggestions welcome (well, all _polite_ suggestions! :-))

103. WWW 130 RELEASED (mkII)

Newsgroup: comp.sys.atari.st
Date: 1996-04-02 00:00:00 UTC
From: Nick@flinny.demon.co.uk
Message-ID: <828557638_OASIS_@flinny.demon.co.uk>
Source record: 147870

Well since my first post doesn't seem to have been sent properly
(demon loosing news articels again?) here is another announcement of
the availability of WWW130

It has the following included with it

* STiK, originally by Steve Adam (Australia) and now by Dan Ackerman
(USA). This does the low-level networking stuff to the Internet.
* CAB, by Alexander Clauss (Germany). The HTML/WWW browser.
* CAB.OVL, originally by Tim Newsome (USA) and now by Dan Ackerman
(USA). This is the missing link between STiK and CAB.
* Antmail, by Dan Ackerman (USA). A POP3 based E-mail program.
* Telnet, by Jim Baumgardner and Dan Ackerman (both USA). This is a
remote login terminal program.
* Setup, by Guy Harrison (UK). Sets up STiK for you with no hassles
guaranteed.

Stik is at version 1.08
Cab at 1.1a
Cab.ovl 1.12
Antmail 0.7.4
Telnet 1.01
Setup 000

You can find them at the following places

My web page (http://www.unn.ac.uk/~cju920/)
Hensa (replaces old www116)
ftp.uni-kl.de (pub/atari/incoming)

I also tried to upload to ftp.cnam.fr and atari.archive.umich.edu but
ran into problems. I may try again later.

Flinny.

>Never tried it myself but unless a *lot* if people have been telling
>porkies in these newsgroups then there is a cab.ovl for Mint.

Oh well, besides I'm using MagiC4..

>Cab itself does nothing with the internet connection. It invokes
>cab.ovl which is responsible for supplying the files Cab requests. As
>there is a cab.ovl for Mint and as Mint supports PPP then the problem
>is solved - except where to get it, which I don't know. However, if
>you post something asking where it is then I'm sure many people can
>help you.

Then where would STiK figure in all this? I though the OVL file just
allowed CAB to work online via STiK?

>I do know that Mint is on plenty of ftp sites. The Mint cab.ovl will
>probably be there as well. The only thing it should cost you is time
>'cos you have to read a lot of docs to get Mint setup right.

That I don't have time for! :-)

>If you do choose to do it though, you will have a pretty powerful
>internet setup.

If CAB didn't come up with the odd runtime error, then i'd say I've allready
got a powerfull internet setup. I've heard today that a new version of the
OVL file is out anyday..vesion v1.2 *I think*

Default Factory Setting (closed or jumpers on E6 & E2):

o o o o o o o
]]
o o o o o o o

E7 E6 E5 E4 E3 E2 E1

E1 - E3 - SCSI ID Settings:

E1 E2 E3 = SCSU ID

open open open 0
close open open 1
OPEN CLOSE OPEN 2 (default)
close close open 3
open open close 4
close open close 5
open close close 6

E4 - Enable SCSI Parity Checking.
(Factory default OPEN - not use).
E5 - Enable Unit Attention after SCSI reset.
(Factory default OPEN - not use).

E6 & E7 is teh Terminator Power options:

Option E6 E7
No power open open
SCSI Power open close
DRIVE POWER CLOSE OPEN
Drive and SCSI power close close
(default is E6=CLOSE E7=OPEN)

That should do it.

Have fun,

Ron

I have an Atari Mega/4 STE. Using ports MODEM 2 or SERIAL 2 I get
115,000 bps (using a 28.8). Run LISTPORT (in the WWW130.ZIP - CAB
and STiK package). This will show your MAX settings. If you are
using STiK already, set the baud rate to 115200 if you have a 28.8
Modem or 57600 if you have a 14.4 Modem.

Hope that helps.

I have a number of Atari ST games from 1987-1989 for sale or trade. I'm asking $10 (including S&H via U.S. Priority Mail) per title. I'm also interested in trading for old Atari 2600/new Jaguar cartridges, so send me your trade list if you have anything of the kind. Here's the list - please reply via e-mail if interested:

Epyx's Rogue
Epyx's Winter Games

Rainbird's The Pawn
Rainbird's Starglider

Firebird's Jewels of Darkness
Firebird's Silicon Dreams

Activision's Little Computer People

Elite's Volume 1 Compilation - Ikari Warriors, Buggy Boy, Battleships, and Beyond the Ice Palace

Source record: 147891
Cross-posted to: rec.games.video.atari,comp.sys.atari.st,comp.sys.atari.8bit

Hello all,

I just picked up my Jaguar Kiosk from Atari and am very pleased with it. Quite huge. Has a controller and all sorts of cool stuff in it. HOWEVER,

It has a video connection I have never seen before. The Jaguar end is the same as we all know but the business end is VERY different.

It has two RCA jacks which are obviously sound and then a 9 pin DBM connector on the end. Exactly like ones you would find on an older IBM compatible monitor. Can anyone tell me what monitor this goes to?

Thanks

-marlin

s> where to store things.

I keep hearing this business about low-level formatting and high level
formatting - previously I was recommended to use Atari's incomprehensible (to
me) CHKDSK3.

Without ever using CHKDSK3 I just partitioned my most recent drive with
HDDriver's utility and away I went. Note: *partitioned* not *formatted*

FWIW HDX has never *ever* worked on any drive of mine - Quantum, CDC or
Fujitsu with either ICD or Atari Host adaptors, using an STe or Mega STe

> Are there any decent screen savers out there?

> I used to use the Warp 9 EOS, but now that I have NVDI, I don't
> use Warp9, and I need a screen saver (that's Falcon compatible).
> Any suggestions?

Hi there,
If you have a Falcon you should definitely get TurboBlanker.
When you have a "green" monitor (or energy star or whatever it's called), the
power save function will get activated AND the Falcon's video chip gets
disconnected, giving you a speed increase of up to 60% !!! (depending on the
operations, naturally). That's what I call a screen saver!
Ok, it can be rather fun watching things floating around on your screen
instead, but of what real use is it?
Go for TurboBlanker is my advice!
It's Shareware and it's really worth registering.

Best regards,

Claes

: > helpful information. Thanks in advance.
: >
: >>>>
: Shouldn't be any problem. I just checked out a Seagate
: Barracuda ST12550N and a ST32550N. These are both 2.1Gig
: SCSI2 Fast Hard Drives, the ST32550N being a Low Profile version of
: the ST12550N. They both worked just fine on my Falcon.
: I saw some posts awhile back about some HD drives not
: supporting a partition greater then 256MB and some limilted at 512MB.
: Any truth to this? As far as I read, no one answered the question. I'm
: using ICD PRO utilities. Anyone, speak up.

: Rich Mier

Well, I found out that yes indeed it does work on it, I'm just
running into the problem of getting software to partition it. I used
cbhd 4.56 to format it, but the partitioning I couldn't get to work (it's
in German and from what I could gather it said that partitioning was not
yet implemented.). So now I'm just wondering what kind of HD fromatter
will support this, (HDX 5.04 won't recognize it) ICD requires the Host
adapter, I believe, and this is the internal drive, so that doesn't do me
any good.
Is HDDriver any good at this? Thanks in advance.

All of you wannabe critics out there, I can really use your help :)
I have the opportunity to purchase either Laser C or Mark Williams C.
What I would like my C compiler to do is:

1- Gem programming: easily and nicely. The shorter, nicer, and easier
the commands are the better. I'm a good programmer, but complicated
system codes give me a headache :)

2- Digitized Sound and pictures. I'd like to develop some games for
Atari, and to do that I'll need to incorporate sound and pictures. My
drawing sucks, so I like filming it all :) Still pictures, such as GIFs
are fine, but if you know of a way either of these can do motion video
from MPEG or SEQ or MOV, or whatever, I'll be most thrilled :) Again,
simple GIF or PI* pictures and AVR sound is more than accptable.

I'd like to thank everyone who responds in advance. Your
critical/joyous review of these two compilers in the two fields or
overall will be greatly apprecaited, and help me greatly in starting to
develop better software. I've developed 2 titles using Pascal, but, well
come on, his is Pascal, how could could they have been :). So to
whomever takes the time to respond, thank you in advance!

Source record: 147934

I'm primarily looking for trades but would accept any reasonable offers.

PLEASE E-MAIL ME WITH YOUR WANTS AND LISTS. READ THE WANTED LIST BELOW!

Qty Description.
APPLE RELATED STUFF
---
3 Franklin ACE 1000 - NOTE: Homebuilders ALL of the chips in this
are
socketed! Mostly LS series. BARE BONES.
1 Franklin ACE 1200 - like 1000 with an updated rom. BARE BONES.
2 Franklin ACE 10 5" floppy drives - noisy but they work good.
1 Apple Disk II 5" floppy drive
3 Franklin video cards (?)
1 Franklin disk drive controller.
1 Franklin ACE 1000(1200) power supply.
1 Apple Monochrome monitor (Excellent Shape!)

PC RELATED STUFF
---
1 BigMouth Voice mail card. works but I lost the software.
1 Epson Equity Ie V30 CPU, Monochrome *VGA* monitor, PS/2 style
101 keyboard, 720k 3.5" floppy (will part out if interested)
1 Microsoft Bookshelf CD-ROM 1992 edition
1 Tandy 3000NL 8Mhz 286, Monochrome monitor, 2 1.44 drives, 640k,
just missing a keyboard (uses standard 5 pin type)
1 Tandy 3000NL 8Mhz 286, power switch broken BARE BONES.
1 386DX20 CPU - pulled from working system.
1 Tandy 1000 - 640k, no floppy drive, needs Tandy 1000 keyboard.
1 Seagate ST21R/22R RLL controller. Condition unknown.
1 Western Digital WD1003V-SR2 RLL controller. Condition unknown.

OTHER COMPUTER & MISC.
---
1 Single trace RCA Oscilloscope, 1 Mhz internal sync with external
sync,
works great, SOLID STATE! Model WO-505A. Don't have an extra
probe,
sorry.
LOTS 64kx1 DRAM chips. 100ns, 120ns, and 150ns.

WANTED WANTED WANTED WANTED WANTED WANTED WANTED WANTED

UV EPROM Eraser! I can even live with a single chip type!
Wire Wrapping tool, squeeze or power type with bits & sleeve.
Wire Wrap sockets and ID tags all sizes needed.

SIMM Sockets (clean pulls with approx. 1/4" leads okay)
Nice soldering iron Analog/Digital that uses readily available tips.
Sider drive controller card.
MacIntosh Computer.
Other Apple stuff wanted - e-mail for list.
Amiga 500, 2000, or 3000 computer.
Other Commodore stuff wanted - e-mail for list.
Atari ST computer.
Atari 800XL keyboard
Other Atari stuff wanted e-mail for list.
TRS-80 Model 4 hard drive
TRS-80 Model 4 LS-DOS & CPM
Other TRS-80 stuff wanted e-mail for list.
Osborne 1 upgrades - DD floppy, 80 column, manuals.
SIMM RAM - any size / speed
4 BNC Ethernet cards.
ALMOST ANYTHING COMPUTER/ELECTRONICS... ask me I just might want it!

: >
: >Does anyone know if the True Type version was ever released ???

: Well, sounds like your in the same boat as me.. I purchased nearly
: everything they made, Fontverter, Megatype, Font Designer Plus and then
: sent them in and PAID for the upgrades nearly 3 years ago this summer,
: and still have yet to recieve the upgrades.. I've called about every 6
: months and get promised that he's about done with the upgrade and will
: even ship me the beta version until he gets the doc's updated. Still
: nothing.. I'm about ready to give up and call again and tell him to
: ship my disks and refund my deposit on the upgrades back NOW!!

I was told it was a FREE upgrade for at least FONTVERTER and TYPE ONE
CONVERTER. Although when I faxed them I was very generous in offering to
pay for the upgrade anyway if there was a fee. But I still get no reply.

In reality, I can't even sell the package as I dont have the original
disks, just the manual.

But at least I havent waited three years..... Ouch !!

: Thanks
: Tom
If it was the bootsector that was ruined, you might check to see if UVK
will fix it. That program has a HUGE amount of game bootsector fixes
installed in it. But I cant tell you for sure that Thunderhawks is one.

HDDRIVER supports partitioning of standard media with 512 physical bytes per sector as well as media with 1024 physical bytes per sector. (Such media are available for MODs with high capacity.)
Note: The demo version of HDDRIVER does _not_ allow partitioning.

:)

I was told by "Don" that it is impossible to notify everyone at this time
the status of their orders. All he said was that they were out of Falcons
and if this changed my order I would be notified.

Hopefully with 21 TT's available I made it in on time :)

Ummm, I could build a wall shelf for the VCR and Video monitor, that would
make room for the TT. For the Falcon it looks like the PC will have to go.
Been looking for a good excuse :)

Ummm, I use an old 1040ST at work with a VideoMaster ST cart.
It is tied to a Zygo interferometer and is used to capture
the fringe patterns off the front of optical missile domes and lenses.
But I guess that's not accounting :)
However it does make it easy to include prints in the reports.

I don't know about Lazer C but I've been using MWC 3.0.9 for *years*
but Lazer is old as well isn't it?

MWC is command line driven, modelled on COHERENT, a unix clone
developed by Mark Williams. It supports a subset of unix type commands
plus pipes and filters but does *not* give you a multitasking system.
There are a good few source code examples on disk and the manual is
excellent, itself containing many examples. The 3.0.9 compiler is
basically K&R - it supports void functions and structure passing but
not void datatypes or ansi function prototypes. It has a darn good
make facility. The command line allows easy automatic construction and
updates of your own object libraries, the linker is quite capable of
handling massive links.

There is no source debugger as standard but one can be obtained (CSD).
In fact, I've managed perfectly well for the last ten years without it
because there is a powerful (optional) assembly code generator phase -
though the assembler has some wierd syntax. It is not possible to
produce inline assembly directly but it's dead easy to call C
functions from assembler or vice versa.

MWC is one of the few assemblers that had bindings for the LineA
interface. The other bindings were very comprehensive for the time and
it is still be possible to write some decent GEM applications with it
today.

It is also possible (with some effort) to get it multitasking very
well under MagiC provided you don't mind pipes and filters being
broken. Another command shell is the solution here.

Personally, I don't consider K&R a disadvantage - compiles fast and
runs fast. It doesn't bother me that MWC are out of business, I've
never had any bugs to report. If you prefer ansii then don't get it!

imo, the biggest problem with it is the libraries. Lots of the newer
OS calls are not there. These newer bindings are trivial to write but
I wouldn't recommend someone new to MWC even thinking about it.

[over to someone who knows Lazer] ...

>So to whomever takes the time to respond, thank you in advance!

Personally, I'm sticking with MWC but imho you ought to take a serious
look at Lattice 5.6 + The Atari Compendium book as it's ansii, still
supported and has all the modern docs as well.

I hope this is of some use. If anyone does get information on the internal
structure of a Signum file, then could they forward a copy on to me as I
might then write some code to convert between formats.

IN>
IN>I heard that it can run windows and it is faster that PC Ditto.
IN>OK I know, Ditto was really slow but I would like to get
IN>Soft PC anyways.
IN>
IN>Would any one send it to me or if shareware post it to the
IN>Toad Computer site at:
IN>
IN>ftp://ftp.toad.net/incoming
IN>
IN>I think it will be of help to all Falcon users.
IN>
IN>If not please tell me where can I buy it. Thanks, Raymond

AFAIK the developpers of SoftPC had troubles with Atari, because they
weren't allowed to produce it. Don't ask me about details, because I
don't know them. I only heard it from someone of Atari Benelux (which
doesn't exit anymore :-( )
I should have a copy somewhere, but I can't ftp and I don't know
where to find it in my diskcollection...
I found it BTW in on a BBS somewhere...

Greetings,

Frits.

Source record: 147953

```
Hexaid is available for download from ftp.mee.tcd.ie/pub/Brian.
Read contents.txt for a description of the files.
I'll be putting 'Anoraks of Doom' there within a few days. I wasn't
sure how much space I'd be allowed, but it looks like there's enough
for the whole Anchovy Trilogy if I ever finish it.
Hexaid has only bombed twice, both times in the text editor, in the last
6 months, and I couldn't repeat the errors, so it's reasonably stable, but
no program ever gets past late beta.

Well don't post one that says that!!

The whole point of NOSSHELL is so you can run OASIS and NOS from dynamic
IPs using STIK!!

I do it, so do many others.

Yours etc.

David.

This thing was made for the ATARI 8bit computers, so it works as a joystick
or as a paddle like input device. There is a way to convert it to use
it with an ST (I had such a converted ATARI trackball), but I don't know how
to do it. I don't think you can do it without knowing more about the trackball.

166. CAB doesn't work with Crazy Dots 2?

Newsgroup: comp.sys.atari.st
Date: 1996-04-03 00:00:00 UTC
From: thopman@uoguelph.ca
Message-ID: <4ju0f0$1oh@ccshst05.cs.uoguelph.ca>
Source record: 147809

The title says it all. I am unable to get CAB working on my Crazy Dots 2 card. It works fine using regular TT video, and appears to load files correctly, display them, etc. etc. However, when I'm using my Crazy Dots 2 at 640x480x256, I get the following errors when I try to load a page from disk (I do not yet have a PPP connection up and running with GEM):

Under Geneva: Runtime error 204 at offset $0003C1DC.
Under AES 4.1: some kind of memory violation. The error message displays too fast for me to get more than that.

Again, CAB works perfectly with the exact same setups (i.e. same AUTO folder programs, accessories) when running in TT medium. I'm not using NVDI; I'm using FontGDOS and the drivers which came with the card.

Any suggestions?

THeo

>Sander.
well word processing programs are no problem.
There's "CRICIT"(CashRegisterandInventoryControl) for point of purchase bar
coding, inventory control, etc.
"LDW Power" for Lotus compatible spreadsheet (or you might want to check out
"Texel" - see the demo!)
"B.E.S.T. business" for handling inventory, invoicing, general ledger,
accounts payableand receivable, statements, cheques, etc.
All sorts of Database programs, heck you may find "AtariWorks" capable enough
for you in the spreadsheet/database area.
"MegaCheque" is a VERY flexible finance package, you can use it for anything,
set it up to do whatever you want!
Taxes are likely to be specific to your area, and you'd have to look around,
I'm sure with the number of fine programmers in theNetherlands that you could
find a tax package, or someone with a spreadsheet template that could be used
for the same purpose.

Check out bigscrn.arc from the Utilities directory of the umich
archive. Doesn't actually do a 640x400 screen on the monitor, but lets
you have a 320x200 window that you can scroll around this larger window!
In fact the screen can be MUCH larger than 640x400 and in 16 colors to
boot! Only way I could get a look at what nethack would look like on a TT
or Falcon while using my STe, also works for the 116 version of the CAB
package. though I will admit it is a little more unstable that way, but
the pages look a LOT better in color! Have fun and find out what a
1200x1180x16 color screen look like!

I don't remember seeing one anywhere..:(

I suggest we all start a (positive..;) postcard-bombing of
Vincent Pomey, the author of ST-ZIP. Unfortunately I haven't
got the address available right now, but it can be found
on ST-ZIP's About-screen. It would be nice to have a new
version of ST-ZIP anyway; the ZIP comment could be longer
than 6 lines and it could be accessible via the shell too,
and so on... ST-ZIP is postcardware, so let Vincent have it!
(I've done my part already..;)

The story behing SoftPC goes something like this ...

Atari asked the developers to write an emulator program, which they agreed to do.
Then when the developers asked them how much are we getting paid and other
questions (just before it was ready for release Atari denied asking them to
write it !)

So the developers just left it and went on to something else.

As far as I know its not PD or shareware !

It is available on the Compo Power CD (I think !)

Personally I thought it emulated a 286 admittedly faster than PC Ditto but not
fast enough for Windows maybe you're thinking of the Sack 286 hardware board ?)

Also you need DOS aswell (preferaby v3.3)

Yeah I suppose the Amiga is a bit better than the ST.
But when I had an ST it definetly wasn't !

Now I have a Falcon and am very pleased with it !
If you have a Web browser then check out my pages as I have lots of info on the Falcon (all the chips etc.)

The Falcon is definetly better than all Amigas apart from the A4000/040 !
Its main asset is a beautiful DSP chip that is rated at 16 MIPS !
(Nearly as fast as the 68040 chip in the A4000 !)
But this chip is limited in use - compression/decompression aswell as conversion and digital manipulation (like with samples). Talking of sampling it has 16 bit sound with 8 channels of 50 Khz stereo music !
There are sound trackers available that allow you to play 32 channel sound trackers!

Software is best from the vibrant PD/ Shareware scene with quite a few decent commercial packages.

As for hardware its mostly PC based - it can take PC memory (you need an adaptor baord) or PC 2.5" or 3.5" IDE drives (the 2.5" ones are standard and will fit into the casing - the 3.5" one you'll need a bigger case !)
They also use PC SVGA monitors or your standard TV !

There are a few accelerators out as well the best being the AdtreBurner040 board which gives an '040 at 64 Mhz with upto 128 Mb of FastRAM.

Urm urm anything else ?
Actually Amiga died and dropped its line before Atari did ...

Anyway your best bet is to get one 2nd hand - that way they come loaded with goodies.
The base model that every thing is written for is a 4 Mb Falcon030 with TOS 4.04 and an 80 Mb hard disk.
They are very cheap now so I'm sure you'll be able to pick up one from somwehere

...

Bye for now,

-Simon

>Hi friends: WWW130 looks great and very impressive :-)

It certainly is! I tried it for 2 hours last night without any bombs at all.

>I have been able to connect and get to different sites, but
>there is a problem no matter what I do and what numbers I change in
>the default.cfg, CAB only loads exactly 6761 bytes and that is all!

I had some problems with .JPG files. CAB requests them and puts them in the
cache and stops. By pressing <esc> the nest .JPG loads ok and CAB stops
again. This has to be repeated for each .JPG .

I also had problems with a big (90kB) .GIF picture. CAB could never convert
the picture to monocrome but simply halted (infinite loop?). When I tried
the .GIF in IMCON it loaded ok.

There are still something wrong with forms. Sometimes it works but one
server interpreted my reply as empty.

On the whole though, this is a major breakthrough. For the first time this
this package really works. It is definitely time to register!

180. ST/TT/Falcon FAQ and FTP Sites?

Newsgroup: comp.sys.atari.st
Date: 1996-04-03 00:00:00 UTC
From: Darius Taghavy <dart@ycrdi.com>
Message-ID: <3162CD4D.7B18@ycrdi.com>
Source record: 147823

Hi, are there any ST/TT/Falcon FAQ and FTP Sites?

181. TT Questions from new owner

Newsgroup: comp.sys.atari.st
Date: 1996-04-03 00:00:00 UTC
From: Darius Taghavy <dart@ycrdi.com>
Message-ID: <3162CCC6.16FB@ycrdi.com>
Source record: 147824

Hi,

I have used ST's since 87, mostly for MIDI and have just purchased a
TT030 which should get here in a week's time. There are things (I think)
I know about the TT and things I definitely don't. If my memory serves
me correctly, a stock TT030 has/supports:

16 MHz 030
standard SCSI i/o w/ external connector
standard VGA monitor support w/ 15 pin VGA connector
can use SM124 mono monitor
battery backed clock
Emagic Logic

But ...
Can one run 640*400 or higher displays in VGA *non*-interlaced?
What is ST vs. TT RAM ? (This machine will come with 2/4 MB)
What type of RAM chips are used?
Is the CPU/clock crystal socketted and can be replaced with a faster
one?
Does C-Lab Creator/Notator run on it? How about X-Or, Steinberg synth
editors, Emagic Sound Surfer and Diver?
Does it have Multi TOS?
Does Multi TOS offer true preemptive multitasking?

What else is special about the TT and what else does it offer over the
1040STf and Mega 2? Why did someone mention the TT is "better" for some
thing than a Falcon?

182. Zip problem

Newsgroup: comp.sys.atari.st
Date: 1996-04-03 00:00:00 UTC
From: Darius Taghavy <dart@ycrdi.com>
Message-ID: <3162CE04.5861@ycrdi.com>

Hi,

I ftp'd a zip file containing an Atari executable to a Mac, unzipped it on the Mac and dragged it to a 720K Dos formatted floppy. On my Mega ST 2, the file shows up as empty and non-executable.
What to do? Is there an ST Zip program and where, if it exists, can one ftp it from?

Thank you for any pointers!

Katherine L Ellis (kellis@mtholyoke.edu) wrote:

: ATARi really sucks in business, not in computer or idea.
: I don't understand their logical.

You compared Atari to CocaCola.. but what do you expect them to do???
They don't have the resources to advertise like hell eberywhere
and promote their product. Its possible that they could've done a bit better
in the 80s, when the ST was doing well or when they still had a
monopoly around the 8-bit games machines. But now? There's no way
they could advertise like CocaCola. That's the logic in it.

I know - this world sucks at the moment. Commercialism isn't a great
thing really - it kills great products. The companies with lots of money
can buy out the other ones, even though they're products are crappy
(Microsoft, Sony, JVC etc.). I don't particularly like this situation
very much either.

: Atari still can work, but there's a lot of work to do, in business.
: The fact that Atari sales the Jag at $99 is a mistake.

Might've been the only way to sell it. I dunno.

: I hope one thing for the corporation. They sale the compagny to german, or
: change the way they manage their product(commercial, availability of
: product ..etc).

The Falcon was sold to a German company, is it doing any better? Nope.
There has been no real developments since the Falcon was bought and
no doubt sails are down. What about Amiga? Same thing.. though escom
is doing a nicer job of it than c-lab the Amiga hasn't really developed that
much recently. If a product is bought by another company it doesn't
necessary mean it's going to do any better. The good thing about it though
is that this new company will at least care about the product.

GET stzip26.tos from the Archivers directory of the umich archive
at ftp.toad.net pub/umich/Archivers I think! transfer it as binary file
type! put it on a 720K IBM type disk. Double click on the stzip26.tos
file on the Atari machine and it will self extract to a nice zip archiver
program with it's own graphic shell.

>Flinny.

I saw this post last night and download WWW130.Zip from Hensa
immediately.

For a couple of months now I have tried to use older versions of
CAB, STiK and CABOVL. But staying online for more than 5 minutes
was impossible, it just kept crashing. Certain pages, including
Hensa's Atari page, couldn't be downloaded sucessfully.
I had given up with it, and was waiting for the update.

I didn't use the new setup program, I just replaced my existing files
with the new ones and put the new STiKTSR.PRG in the auto folder.
Reset to load the new STiK.ACC etc., connect with STiK and ran CAB.
I surfed for 15 minutes without a single problem, I only stopped
because it was getting late. A figure previously unattainable.
Pages that have been problematic before loaded first time.
Brilliant!

The one problem I still found was the forms. As mentioned by someone
else in another thread I couldn't get the FutureNet subscription form
to except that I had type in all the details.

Congratulations to all involved. After some more testing to,
hopefully, prove my initial findings, you can expect my registration
fee fairly soon.

To all of you that have become disillusioned with Web browsing on
your Ataris try this and think again.

Rich.

Source record: 147837

Darius,

The TT is a 32MHz machine. You can bump it upto 48MHz with a CaTTamaran
for about $100.

TT ram is about twice as fast as ST RAM. Depending on the TT RAM board,
it may have SIMM chips, which can be replaced with 4-4MB SIMMs to give a
total of 16MB of TT RAM.

The TT also has an internal SCSI connector for a harddrive.

On a standard VGA monitor, you can run 640x480x16 or 320x200x256, plus
all the standard ST resolutions.

Hope this helps.

By the way, did you get one of the last TT Atari was selling?

Big, big, big sorry!

Shooting from the hip when tired (at about half four in the morning) never results in a good message - hence the naff tone of my original post. (Somebody quietly mutters in the background 'excuses, excuses' !)

As to the package as a whole, I've not had a crash yet - it's excellent. Top marks for the inclusion of the Setup program - worked first time. But one small question, the Demon nameserver address - isn't it ?.?.?.65 and not ?.?.?.43 as in the setup files. I'll admit I changed it to .65 before using the .43 and everything worked with it - but is .43 correct as well?

That's something Amiga's don't have.

[snip]

> There are a few accelerators out as well the best being the AdtreBurner040
> board which gives an '040 at 64 Mhz with upto 128 Mb of FastRAM.

040's don't go beyond 40 MHz. They do have an internal clock-doubler, but all
instructions take an even number of cycles. So effectively it's still 40 MHz
(32 in this case).

> Urm urm anything else ?
> Actually Amiga died and dropped its line before Atari did ...

In a few months Amiga Technologies will release the Walker, the newest Amiga.
It is based on a 40 Mhz 030 and will cost about $1100.

Early '97 we will see the PowerAmiga. The specs look real good. Amiga Technologies was owned by Commodore but when Commo screwed up they were bought by Escom.

Rich,

I won't bother quoting some of the comments that you made; it would be fruitless...

IMO, you have about as much spite bottled up against Ralph/STReport as you claim Ralph has regarding Atari. If you bothered to actually _read_ an issue of STReport, you'd know that he is not responsible for reporting any of the Atari material contained within. But, you don't mention that in your message.

And don't bother pointing out that it's Ralph's responsibility for the entire content, so it's his problem. It won't wash.

Again, if you read the article that you quoted so very well, you would have noticed that it was an article written by Scott LeGrand, and posted here a couple of years ago, and then re-posted a week or so ago. It was cross-posted on CompuServe, where I found it. I put it into STReport, in a column aptly named: >>"Online Users Growl & Purr!". It's a "feedback" type of column. The CIS poster mentioned that the article was humorous - his quote, not mine or Ralph's. Wherever you find a reason to claim a "deep-seated hatred for all things Atari" is your perception; and a wrong one - whether it be directed at me or Ralph (I'm assuming Ralph). Slander? Yeah, right. How about satire - Scott did it well; and remember it's 2 years old, or older.

Impartial reporting? Again, I re-posted some Atari satire. Deal with it.

You have an axe to grind with STReport, Ralph, or myself - go for it. But, if you're going to do so, at least get your facts straight instead placing errant blame.

well here's some info for ya....
---------------------------------------
Barracuda 040=BF - Falcon 030 Accelerator
---------------------------------------

Who needs a Barracuda 040?
-------------------------

Anybody that wishes to accelerate their Falcon
030 computer.

What will a Barracuda 040 do for me?
-----------------------------------

The Barracuda 040 will greatly enhance the
performance of the Atari Falcon 030 computer
system. It will give you the speed, performance
and options unparalleled to any other accelerator
available today. It will increase productivity, by it's
raw processing power alone.

Specifications and Features:
---------------------------

* 68040LC-33MHz or 68040-33MHz
* Performance increases to 900%
* Fully 68030 compatible
* 8 Kilobyte on board cache
* 1 wait state operation
* Memory expansion from 1 Megabyte to 128
Megabyte of 32 Bit Local RAM
* Memory Management unit
* Floating Point Instruction Unit 040 only
* Enhanced video output, software driven for
higher video resolutions up to 1280 by 1024
* Enhanced DMA control and access
* 32 Bit Flash ROM (for easy OS upgrades)
* Full system control logic supported by on board
custom ASIC design
* Video Expansion Buss
* 2 VME busses (96 pin) for use with plug and
```

play options

Options:
----

* 68040-33MHz with FPU
* RAM Card memory expansion from 1 Megabyte to
128 Megabyte of 32 Bit Local RAM
* 486DX-33 MHz PC Emulator
* Video Funnel - Video Frame Grabber
* Ves 2000, 3000, 5000 - Video Editing System

Availability - February 1995

Some Commonly Asked Questions:

Q: Will the Barracuda 040 fit in my stock Falcon case?
A: No, because of the limited power supply included with the
Falcon 030, as well as space restrictions, the user will need to
use an alternate mounting enclosure with larger power
supply.

Q: Is the Barracuda compatible with my existing software?
A: Yes the Barracuda is 100% backwards compatible with all
current software packages.

Q: Are there many problems with the Falcon's DSP?
A: NO, Extensive testing has been done to assure proper
operation with the internal DSP, all timing associated with the
DSP will now be handled by the Barracuda 040.
=20
Q: Can I install the Barracuda 040 myself?
A: Yes, although some technical knowledge will be necassary,
the installation has been mad fairly simple, some soldering will
be required.

Q: What do I need to know about the RAM option?
A: The RAM card supports from 1 Megabyte to 128 Megabyte of
local RAM, (TT compatible). The only restriction placed on you,
is all 8 banks of memory must be occupied by memory of
the same type. E.G. If bank on uses a 1 Megabyte
SIMM, then the entire board will need to use the 1 Megabyte SIMMs,
giving you a total of 8 Megabyte of local RAM. 4 Megabyte
SIMMs will give you 32 Megabyte, and 16 Megabyte SIMMs 128
Megabyte.

Q: What about RAM speed?
A: 60 to 70 ns is recommended.

Q: Does the extra RAM help system performance?
A: Yes, local RAM increases system performance greatly.

PRICES M.S.R.P.

* Barracuda 040 from $800.00 US
* 68040-33MHz Proc. Upgrade $150.00 US
* RAM Expansion $300.00 US
* 486DX-33 PC Emulator $400.00 US
* Video Funnel $600.00 US
* Video Editing System from $1500.00 US

I think the www package needs to be split up, as its getting rather large.
i.e. STiK & Config in one archive, CAB in another, Antimail, etc...
This will make it easier on poor blokes like me who can't afford a SLIP
connection, and just want CAB for viewing stuff offline. MiNTnet folks
will like this also...

This article may also be laughed at and deleted freely as it is a nice
specimen for this year's April fools day.

However, If you computer _does_ get infected by these silicamites,
treating the whole PC including any peripherals like monitors, printers,
modems etc. generally cures the problem.
This treatment is carried out in seven small simple steps:
1) Cut all wiring inside the computer to prevent new infections.
2) Clean everything using 99,8% pure high-octane petrol fluid.
3) Immerse the whole system in a Mercury/Sodium solution.
4) Dry the system using an oven heated up to 144 degrees.
5) Repeat steps 3 to 4 for eight times, increasing temperature to 200 C.
6) Put the entire system in a freezer for 72 Hours.
7) That's it. You will never be bothered by those silicamites again.

The above *may* slightly damage your computer but, hey, it *is* a cure
for Silicamites. Guaranteed.

Of course everything works with Metados. The critical part is the
.BOS driver. The one atari uses does only work with the CDAR.
But if you have a different .BOS driver it works fine.

>there. Hopefully this will be fixed in WWW117.
>
>John Stanmeyer
>
Does this occur where the HTML instruction is MAIL TO? This is a HTML
extension not yet supported by CAB. I assume the forms which do work (all
the major search engines) use a different HTML command at this point,
though I haven't spent much time investigating this. There is definitely a
difference, and it's totally repeatable. One style of form will always
work, the other style never works.

I think we'll have to wait for another CAB upgrade before the forms
handling is improved; presumeably adding MAIL TO means also adding an
e-mail option on clickable e-mail addresses, plus some kind of option to
delay STiK from timing out.

Meanwhile at least we've now got a stable web browser up and running -
I've tried for weeks to get this one to crash and found it very difficult
indeed, if not impossible. Assuming Guy's set-up prog works for your ISP
it should be almost Plug'n'Play now!!

Best wishes

Andrew

210. STiK/MagiC tip

Newsgroup: comp.sys.atari.st
Date: 1996-04-03 00:00:00 UTC
From: andrew@ajrose.demon.co.uk
Message-ID: <828621008_OASIS_@ajrose.demon.co.uk>
Source record: 147853

Not sure if this is in the docs, but I'll pass it on anyway:

When using STiK under MagiC always make sure that no pre-emptive multitasking is taking place. Either turn it off using the CPX or run applications under single TOS after dialling in.

Why? It stops those endless halting delays when you appear to be sending vast quantities of information upline.

The result? It'll increase your browsing speeds by many times!!!

Happy browsing :-)

215. Gemulator questions

Newsgroup: comp.sys.atari.st
Date: 1996-04-03 00:00:00 UTC
From: gustavo@dent.uchicago.edu
Message-ID: <Dp9nJB.1MJ@midway.uchicago.edu>
Source record: 147899

Hi everybody!

I am considering getting a Pentium machine with Gemulator;
however I have come across two bits of apparently contradictory
information, one coming from Toad Computers and another one from
Branch Always Software. In Toad's catalog (and in their WWW site),
they are advertising Gemulator 95 as a product capable of running MIDI
programs (unless they are copy-protected, or require a dongle --case
in point, Cubase) and with joystick support. However, Branch Always
describes their newest version of Gemulator (4.15) as not having
either capability for the moment. What's the story? Who do I believe?
Are they talking about the same product? The point is that while I
could not care less about joystick support, I am mainly interested in
MIDI applications, more concretely, KCS and XOR, and if these won't
run, then I'll have to look at other options. Also, another thing I'd
like to know is what other hardware I will need to run those
applications, given the fact that IBM compatibles don't have built-in
MIDI ports. Any informatiion on these matters will be appreciated,
especially from people who succeeded in running those programs (or at
least tried). Thanks in advance.

Gustavo

216. Major WWW130 bug

This COULD be missunderstood... I know for a fact that Daron DON'T have a DEC with a ALPHA CPU! It's a DEC alright, maybe even named ALPHA, but it's from another century then this :^D (Hello Daron! :)

>It looks a lot like a derelict spacecraft, but at least we're up and
>running for mail once more.

Actually the DEC you have looks like it's from a StarWars movie :^D

Source record: 147707

Is there any place where I can get some Signum!3 fonts? Preferably PD or
something. I'm particularly interested in: (in this order)

Times italic
Times plain
Helvetica

TIA

I personally would prefer my AmigaOS 3.0 over my Atari's MiNT anytime. My apps
(like POV) run faster on my 68EC020-15MHz than on the Falcon with it's 030.

The DSP56001 is nice though.

> Ha! -Amiga owners! <spit>

Are Atari's still being produced, btw?

> (I used to have an Amiga, before the Falcon, but don't tell anyone!! :-)
I have both :-P

>So now come the flood of inevitable questions. These TTs have 2 megs of
>ST ram and 4 megs of TT ram. Is the ST ram upgradeable to 4 megs (or
>more)? Is it SIMMs or is it surface mounted like in the ST? Does all
>this depend on the version of the motherboard in the particular machine?

The 2 Meg ST RAM is soldered onto the motherboard. And there is an
expansion slot for a add on ST RAM card. Usally this add on card is a 2
MEG version, but there exist one card that has 8 Meg :^D (That will give
you 10 meg ST RAM!)

It's NOT SIMMs, but a special card about 100*160 mm big, which has good
old DRAM's on it :^D

There CAN be some difference between the revisons of the motherboard, but
I think it's about the same!

>Two megs of RAM seems like an odd number (isn't it usually 1 or 4, or
>multiples of 4?. Is the TT ram the same story?

THe TT ram is entirely on a daughter board, and atleast the one I have
van take 16 Meg RAM (4 * 4 MEG SIMMs) I know there is some 3rd party
manufactors that has TT ram cards that can take MORE then 132MB RAM :^D

>Will I be able to use my old SM 124 monitor with the new machine until I
>get the wherewithall together for a new VGA monitor?

NO! You need a VGA or a TTM194 Mono monitor (19" big!)

>Thanks and Sorry to all who tried to get in and didn't make it. I don't
>mean to post here to gloat, and any introductory info on TT ownership
>some kind soul can provide will be sincerely appreciated.

TT's are great!

> released on 02-14-96.

Would it be possible for those posting articles that mention dates, to please refrain from "all numeric" dates such as the one above?

Obviously, the date is February 14th, but, as someone domiciled in a country that formats dates as DD-MM-YY, the first thing one thinks of is "2nd daty of 14th month of 96". That is obviously incorrect.

Confusion is likely to arise, especially with dates like "4/5/96". Is that 4th of May, or April 5th?

I propose that one sets a pseudo-standard of writing the month as a word (or an appropriate abbreviation).

ie 04-MAY-1996. This leaves little to chance - the day, month and year are obvious. Unlike 4/5/96 or 5/4/96, depending on where one grew up.

: Hi friends: WWW130 looks great and very impressive :-)

: I have been able to connect and get to different sites, but
: there is a problem no matter what I do and what numbers I change in
: the default.cfg, CAB only loads exactly 6761 bytes and that is all!

: any help on this?

: Raymond

I have had it for only a day and have experienced a similar problem in
that it seems to "stick" on most JPG's. It will load in a certain amount
or moast of the pic then stop cold. I have to hit the escape key to get
it to resume the rest of the page, unless of course it hits another JPG.

It doesn't do it all with all of them however..... I'll keep my eyes out
for another clue.

Other than that, it works BEAUTIFULLY !!!
I have gotten to pages I never could before (most with HUGE amounts of
graphics). CAB has improved in that page counters can now be seen. HR
(horizontal rule's) are now properly displayed and I like the fact that
when you grab an Binary file it asks you where to put it and allows you
to rename it at the same time. Very nice improvements. I'm sure there are
more but I havent caught all of them yet.

Kepp up the GREAT work guys !!!

Dunno all your questions but its the same as mine.
With ScreenblasterII from Compo (RIP)
I get 806*600 in 16 colours and can go a little higher
And around 760*570 in 256 or there abouts
I know they're non standard but I never got the hang of the
configuration prg :)
Still www130 looks pretty damn fine at that rez and much higher would
have small text unreadable.

I'll have another look at the figures if you like?

Cheers ....Greeny

Hi there...

DOMINGO@DELPHI.COM (DOMINGO@news.delphi.com) wrote:
: Okay, so this really has NOTHING to do with the original post, but since
: you have PowerUp 2, could you let me (us?) know how well it works?
: Maybe some GEM Bench stats or just your general feeling of its utility?
: I am thinking of the BlowUp F/X board, but I already have ScreenBlaster
: and will probably be getting a 14MB RAM board soon. I also heard that
: BlowUp F/X is flakey with 14MB's of RAM and no RAM on the board.

If you want real huge (hairy appendage) type acceleration, then PUp2 is not your thing. The PUp2 in my Falcon is quick enough to make a very noticeable difference to my machine however. Typical GemBench figures are below...

I have related these to a stock 16MHz Falcon

Integer Math 200%
Float Math 121% (I have a 16MHz 68882 FPU installed)

Over all I notice the snappier screen updates, doubled performance of mathematics (integer only), and would say at a guess that you would look at about a 25% increase in overall performance of the Falcon. It doesn't beat an FX board or Afterburner, but is still not bad IMHO...

Hope this helps...

Chris W.

Gustavo Comezana (gustavo@dent.uchicago.edu) wrote:

: Hi everybody!

: I am considering getting a Pentium machine with Gemulator;
: however I have come across two bits of apparently contradictory
: information, one coming from Toad Computers and another one from
: Branch Always Software. In Toad's catalog (and in their WWW site),
: they are advertising Gemulator 95 as a product capable of running MIDI
: programs (unless they are copy-protected, or require a dongle --case
: in point, Cubase) and with joystick support. However, Branch Always
: describes their newest version of Gemulator (4.15) as not having
: either capability for the moment. What's the story? Who do I believe?
: Are they talking about the same product? The point is that while I
: could not care less about joystick support, I am mainly interested in
: MIDI applications, more concretely, KCS and XOR, and if these won't
: run, then I'll have to look at other options. Also, another thing I'd
: like to know is what other hardware I will need to run those
: applications, given the fact that IBM compatibles don't have built-in
: MIDI ports. Any informatiion on these matters will be appreciated,
: especially from people who succeeded in running those programs (or at
: least tried). Thanks in advance.

: Gustavo

Toad is incorrect. The current version does _not_ support MIDI (or even
sound for that matter). This advertisement is misleading. Actually, I'm
still waiting to see some joystick support.

Rich Tietjens <starship@3rdplanet.com> writes:

>This is an extract from STR #1213, the most recent to my knowledge. I
>didn't bother to read the whole thing - it only contains a small section
>relevant to Atari. Part of that was (deliberately?) truncated, reporting
>Atari's sell-off of some warehouse stock but neglecting to report what was
>being sold and what the prices were.

A few comments:
-
A) A pro-Atari or even non-anti-Atari Ralph Mariano is an amusing and
remarkably strange thought. So Ralph's a jerk. Most people have known that
since 1987.
-
B) Re: the Jaguar release parody. Unfortunately, he's right. COnsumers
are being burned once more by Atari Corp. via the Jaguar. It's another
Falcon, another ABAQ, another Panther, another ST-PAD, another ST-BOOK.
Developers who believed in Atari and developed for the Jag are being screwed
right and left. Key employees like B. Rehbock who devoted great time and
energy to getting this off the ground have been screwed. Most Atari employees
have been screwed. Atari creditors and shareholders have been screwed.
Loyal factions of Atari userrs have been screwed. So while Mariano is
stating the obvious in a rather snivelling, arrogant tone, this time, he's
right. Of course, it's been alleged that ABCO has done a fair share of
screwing.
I once heard someone say ABCO stood for A Big Crook's Operation. Demanding
impratiality from ST Report is a futile effort. I've tried many times.
-
C) Ever wonder why Atari always survives catastrophes with large sums of
cash? It's probably because none of that cash was invested in any marketing
operations. After they got a large base of users by pricing the ST cheaply,
they fed off these people rather than make a real attempt to sell to a\
broad-based market segment. Fortunately, we have real producers and
supporters of the system in the TOS market, and I suspect Jaguar will go the
same route. The sooner Atari Corp. is shedded and forgotten, the better for the
long-suffering users!

Kristoffer Lawson <krlawson@xgw5.pal.xgw.fi> writes:

>They don't have the resources to advertise like hell eberywhere
>and promote their product. Its possible that they could've done a bit better

This is an extremely old and boring argument. As a former Atari shareholder, I realized that this argument was a copout when I saw how much cash Atari would have after dropping a product. They had $32 million after dropping TOS machines, $50 million after dropping Jaguar. All of this is cash that any company confident in its products would have invested in marketing. However, after retailers were burned by Atari, developers were burned by Atari, and users were burned by Atari, noone would take a chance and buy their products (if they even knew they existed).
-

>The Falcon was sold to a German company, is it doing any better? Nope.

Doing considerably better - it's being produced, updated and supported. C-LAB isn't begging developers to expend millions creating new titles, only to drop it months later. C-LAB is a fraction of Atari's size, yet tehy're doing a great job developing and supporting the system. Medusa and other firms are also releasing machines like the Eagle and HADES. These are all great developments - far more than Atari would have made with the technology had they actuially stuck to it for more than six months.
-

>is doing a nicer job of it than c-lab the Amiga hasn't really developed that
>much recently. If a product is bought by another company it doesn't

The Hades and Eagle are both light0-years beyond the Amiga. TOS is now an open market segment for computer-makers. Just about anyone can make a good TOS system, since MagiC and TOS are readily available for licensing. Sorry, Atari. I've been burned one too many times by ya. Not that it matters, now that you're gone. Thank you C-LAB and others for a great job supporting us - you have proven that the developers, as always, are the real force behind TOS' success.

Hello --

I just acquired a 520 ST and am looking to buy a few games for it:

Tenth Frame Bowling
Leaderboard GOlf access key (I have the original disks/box/manual but no key)
Leisure Suit Larry (the original!)
Test Drive
Rings of Zilfin
Death Sword (Epyx)

If anyone has any of these for sale (reasonably cheap %^)), please E-mail
me at aa852@cleveland.freenet.edu.

Thanks!

>Then where would STiK figure in all this? I though the OVL file just
>allowed CAB to work online via STiK?

Correct. It is the interface between STiK and Cab. Mint has its own
drivers so all you need is a cab.ovl which can talk to Mint instead of
STiK.

>>I do know that Mint is on plenty of ftp sites. The Mint cab.ovl will

>allready got a powerfull internet setup. I've heard today that a new
>version of the OVL file is out anyday..vesion v1.2 *I think*

STiK will have PPP but when is the problem. I can't speak for the
author but if I was doing it, PPP would be the highest priority.
Fortunately I'm not because I know little about PPP except it's not
one of those things you can knock together quickly. It's going to take
quite a bit of testing!

Source record: 147736

Hi to all:
Whiles it is true that I am having troubles with WWW130 (and also other people)
WWW130 looks great and we all should be thankfull that some people have
put their positive energies toguether to produce something for the bebefit
and enjoyment of all.

I take the time to say this because some people just complain about what
it can not do tec. While some of this could be of help, it could be very
dissapointing to the ones who I am sure have put many hours of hard
work on it.

So, I am sure that most of the problems can be solved in the set up nad
confg, files. IBM people are having problems still with WINDOWS 95
(which should be called WINDOWS B.C. really) and they paid for it!

Lets all be thank full for what we have and get for free and trust
our friends as they (the programmers) have shown that they are dedicated
and whant to bring a fine program for all Atari-C-lab users to enjoy.

Do IBM users get this kind of support for free?

Thanks, guys you are doing well. Raymond Lohengrin

Same here - I sent a gloriously large postcard ...

Another thing the ST ZIP could do with is multi-volume ZIPs!
At the moment it can't recognise these ZIPs created from PKZIP etc.
At least ARJ does but it would be nice to have compatibility with the
rest of the ZIP world.

This one must of squeezed it's way past the search lights :-)

>You can find them at the following places
>My web page (http://www.unn.ac.uk/~cju920/)

I didn't expect to find WWW130 there when I visited your page as I thought it would be a few days off but was supprised to find it :-) I think there might of been a few more downloading it at the same time. Luckily the old version of WWW117 or was it 116 held together while downloading,pheeeeew :-)

I read about a Minix partition in the CAB Doc. What is a
Minix Partition anyway? Could I do it on my STE/HD without re-partitioning it ? Is there any info or a FAQ on the subject do you know ?

Sorry about the questions but this Minix thing is new to me. I haven't read anything about it before. The only time I've seen it mentioned was in the CAB Doc's.

Cheers :-)

Thanks for the feature list Phil. It sounds quite exiting. I have three questions.
1. Is OASIS II/ICE compatible with hsmodem ?. I ask this because of the comment that desk accessories are not accessible and one uses the modem accessory to set up hsmodem

2. How will the update be distributed especially for those of us that have pre-registered

3. When will the WWW browser be incorparated ?

There seems to be another alternative path !
Black Scorpion Software are developing an accelerator for plain Falcons but will take advantage of the AB040 if plugged in (to give you a high bus rate and fast DSP)

Its in prototype stage but at least it should support the AB and that means all their software should do as well !

Hopefully some other UK firm can take over the distribution for the AB ...

From: c4sy@dmu.ac.uk
Message-ID: <4k0pkb$ji@macondo.dmu.ac.uk>
Source record: 147742

I have a friend who is virtually giving away 4 x 4 MB SIPPs !

There must be a way to connect them to my Falcon ?

I have heard of a PC-type board that will allow SIPPs to plug-in and gives me
one 16 Mb 72 pin SIMM.

Are there any other ways ?
Could it be possible to convert them into SIMMs with a simple adaptor ?

If anyone has some ideas or info then could you preferably e-mail me as I won't
be able to get to this newsgroup over Easter and all replies will of probably
gone !

Thanks,

Simon

258. Atari "Warehouse" Sale

Newsgroup: comp.sys.atari.st
Date: 1996-04-04 00:00:00 UTC
From: ad910@lafn.org
Message-ID: <1996Apr4.045106.11796@lafn.org>
Source record: 147743

Like most everyone else, by the time I heard of the fantastic bargains, The real stars of the show (the US Falcons and the TT's) have already found homes.

But there are quite a few things left. I received a revised list today, so I'm passing it on instead of hoarding it.

THERE ARE FALCONS, but they are UK and German versions and go for US$450 + Shipping.

Post follows:

Date: Thu, 4 Apr 96 01:20:00 UTC 0000
From: atari@genie.com
Subject: Sale
To: ad910@lafn.org

Reply to message 6988771 from AD910@LAFN.ORG@INET02# on 04/03/96 6:07AM

Bobby,

As of now, I am out of TTs and Falcon (US) versions.

PLEASE READ IN A PROPORTIONAL FONT EDITOR...

TO: Atari Devotees at Large

FR: Earthbound Internet Inhabitant
(a.k.a. Don Thomas @ Atari)
REPLY TO: 75300.1267@compuserve.com or atari@genie.com
SUBJECT: *VERY* LIMITED OFFER (3/27/96 - 4/15/96)
AND WHILE SUPPLIES LAST
REVISED: 4/3/96 1:00 PM Pacific Time
==========
As you may (or may not) be aware, Atari Corporation has relocated our corporate offices to a shiny new facility in beautiful downtown Sunnyvale, California. Now, it's time to move our warehouse facility to a location that makes more logistic and economic sense to our offices.

I am pleased to say that I have obtained Mr. T's and Mr. T's and Mr. T's (one T didn't need to reply) authorization to dig amoung the muck and find some worthwhile "stuff" for our long term friends and supporters on the Internet. I was told to "put aside what you (meaning me) tink people might like and we'll consider letting you offer it on-line for a weekend or two". I've done that and have gotten approval to give away the items below at incredible prices.

Please, be advised that although these items are available at outstanding values, they are "as-is" and probably don't have boxes or instructions (all games probably have instructions although they may be photocopies). These are trade show returns, refurbs, store returns, reclaims, employee use items, media review returns, developer on-loan returns, etc. There are NO REFUNDS and the standard 90-day warranty will not apply.... BUT every item is guaranteed to work for a 30-day period or it will be replaced or repaired at Atari's option. Some of the items may have slight scratches or other small cosmetic packaging flaws. None are being sold under new conditions.All items are in limited quantity and subject to prior sale. It will be best to order by credit card so that we can adjust the transaction accurately if we are unable to ship everything requested.

Okay, enough with the protect my a$$ stuff here's how to order... Send me an E-Mail to:

75300.1267@compuserve.com OR
atari@genie.com

OR fax the information to 408/328-0909. NO PHONE CALLS PLEASE on these items. You may also snail mail your order with a money order (or credit card) to:

Don's Wonderful Wacky Way Out Deal for Internet Dudes & Dudettes
c/o The Atari Corporate Company that moved recently
P.O. Box 61657
Sunnyvale, CA 94089-1657

Money Orders, MasterCard or Visa accepted as valid payments. your order must include:

Name (First and Last)
Snail Mail (shipping) address
City, State, Zip, Province, Apartment, Tree, etc.
Day and night and weekend and holiday phone numbers
Internet address
Exact payment in Money Order form OR
MasterCard/Visa number and expiration

As a rule, shipping is $5 for every $100 (or fraction thereof) of your order, but you will be notified of exceptions. Foreign orders will have a modest surcharge for shipping.

So are you still with me? (By the way, all prices shown do not include shipping/handling and applicable California taxes). Oh, the quantities shown are for general reference. You do NOT have to buy that many. <g> Prices are all U.S. funds only.

One last thing, all items are first come, first serve. Asking questions about the products will not reserve them for you. <g> Your order will be printed and placed in sequence for the order takers to input. If we have the product and your order is complete

and your payment is accepted (approved by the bank), we will finish the order and ship within a couple of business days. If cannot complete the order for any reason, the order takers will move to the next order and I will reply in EMail to you for additional feedback. Please understand that, at these prices, we want to prioritize orders we can process. If you require a great deal of service prior to your decision to purchase, please contact your nearest retailer. Please be advised that S&H may be adjusted. If you are ordering heavy items, expect that S&H may reflect that.

ITEM 1 QTY INTERNET PRICE

Assorted Lynx Software a few of most titles Any 1 = $12 ($12 ea)
Any 3 = $33 ($11 ea)
Any 5 = $45 ($9 ea)
Any 10 = $75 ($7.50 ea)
Add identical title = $6.50 ea

Note: I can probably get my hands on most any title published by Atari with exceptions to the following:

AGAIN, THESE ARE *NOT* AVAILABLE:
- Blue Lightning - California Games
- Checkered Flag - Electrocop
- Gauntlet - Hard Drivin'
- Lemmings - Lynx Casino
- NFL Football - Ninja Gaiden
- Ms. Pacman - Paperboy
- Roadblasters - Warbirds
- World Class Soccer - Xenophobe
- Zarlor Mercenary

Do not ask for third party titles... I ain't got 'em. <g>
To see a complete list, visit: http://www.atari.com on the web and get the list from the Lynx order area. Note that no matter how many you buy, you get the second (or third, etc.) of the same title for only $6.50 each. This is for you ComLynx want-a-bees <g>. $6.50 priced games do not count toward any other discount formulas.

ITEM 2 QTY INTERNET PRICE

Jaguar demo kiosk STILL SOME LEFT $150 plus $130 S&H

These are the big, heavy suckers we take to trade shows. The ones I can sell are trade show returns and may have minor flaws (like a little sticky tape that comes off with lighter fluid). You have to provide the monitor and the Jaguar. If you have seen these things, you know how much fun it would be to own one. Perfect for bedrooms, rec rooms, the garage, or in the lobbies of professional offices where children could be entertained. If you haven't seen these

things, then picture a cabinet that looks just like an arcade machine. Convenient shelf for small monitor and there's room for the Jaguar AND the CD-ROM.

ITEM 3 QTY INTERNET PRICE

SC1435 color monitor SOLD OUT!

ITEM 4 QTY INTERNET PRICE

SC1224 color monitor NOT MANY $65 plus $20 S&H

First come, first serve.

ITEM 5 QTY INTERNET PRICE

TTM195 OUT OF STOCK!

ITEM 6 QTY INTERNET PRICE

PCM124 29 $55 plus $25 S&H

PCMonochrome12"version4
You know ou want this. <g>

ITEMS 7 - 10 QTY INTERNET PRICE

Lynx pouches couple dozen $4
Lynx carry cases another couple dzn $10
Lynx battery pack okay, a lot $4
Lynx power supply not as many as a lot $4.50
Deal of deals... $6 for power supply AND battery pack

ITEM 11 QTY INTERNET PRICE

Lynx with 4 (random)
games a few dozen $45 each / 2 for $80

Note: These are prepacked systems with 1 of 5 different assortments. No, we cannot guarantee what titles or that more than one purchased system at this price will have different games.

ITEM 12 QTY INTERNET PRICE

Atari binders much too many 1 = $2.00 ($2.00 ea)
3 = $4.00 ($1.33 ea)

5 = $5.00 ($1.00 ea)
10 = $7.50 (.75 ea)
25 = $10.00 (.40 ea)
50 = $15 (.30 ea)

Don't laugh, these are cool 3-ring binders; all in great condition.
All from the Warner days.

ITEM 13 QTY INTERNET PRICE

Falcon computer (US) SOLD OUT

ITEM 14 QTY INTERNET PRICE

Falcon computer (UK)
4 Meg RAM plus
hard drive bracket.
IDE drivenot included STILL SOME LEFT $450 plus $45 S&H

ITEM 15 QTY INTERNET PRICE

Falcon computer (German)
4 Meg RAM plus
hard drive bracket.
IDE drive not included STILL SOME LEFT $450 plus $45 S&H

ITEM 16 QTY INTERNET PRICE

TT030 computer OUT-OF-STOCK

ITEM 17 QTY INTERNET PRICE

SF354
Single-Sided Drive YES, we have more $18

great for classic 16-bit computer games or applications

ITEM 18 QTY INTERNET PRICE

SLM804 laser printer 8 $75 plus $35 S&H

great as second or for parts, may be missing drum

ITEM 19 QTY INTERNET PRICE

XM301 8-bit modem 63 $4

Common' get one just to say you have one. <g>

ITEMS 20-23 QTY INTERNET PRICE

Portfolio:
Smart Parallel dozens $5 each
PC Card Drive dozens $5 each

64K Memory Card 100s 1 = $12 ($12 ea)
(batteries may be 3 = $27 ($9 ea)
doorknob dead) 5 = $35 ($7 ea)
10 = $50 ($5 ea)
25 = $88 ($3.52 ea)
100 = $99 (.99 ea)

Have fun and enjoy. If I find more of something, I'll see what I can

Yes but financial results from Escom show that things are not all well with Amiga Technologies. Its one thing for the R&D and Marketing Depts to say the above but another when the boss takes away all investment...

It probably doesn't like the fact you're Pro-Amiga :-)
Sounds like a duff DSP - which are fixable ...

A Falcon without a DSP is seriously crippled, think of all those Demos, Sound Trackers, Samplers, Games (like Bad Mood) which are unusable !

264. Computer Animation Object Files

Newsgroup: comp.sys.atari.st
Date: 1996-04-04 00:00:00 UTC
From: ad910@lafn.org
Message-ID: <1996Apr4.052155.20445@lafn.org>
Source record: 147749

I keep hearing wonderful things about Apex Media and In Shape, but, from what I can gather from the advertising blurbs, none of them has the 3d object creation and editing power of good ole' Cyber Sculpt.

This isn't a statement of fact, just an impression of what's out there from someone who is still using the Cyber and Phase IV packages... but is looking to upgrade.

So where do we get object libraries? Are the Falcon oriented packages, Apex, InShape et. al., able to read and manipulate/render objects created on other platforms? Once they import the objects, are these new programs able to tweak them point by point and face by face like Sculpt?

I'd love to find some FAQ files that could give me an overview of the various object file types, and their formats, on all the platforms.

And most of all, while I'm waiting to win the lottery (at which time I be able to afford a maxed out falcon system and all the software goodies), Are There Any Conversion Programs To Convert Object Files From Other Platforms To 3D2 so I can use them with Cyber and Chronos?

I got Rosetta from Lexicor, but it didn't work. In talking to Lee Seiler, he claimed this was an illegal copy made by a distributor without his consent. He asked for the original I had purchased and a copy of my sales receipt. Being a good anti-pirate, I complied... but I never got a "good" copy of Rosetta back from him. And support and upgrade privileges were revoked for Chronos and Prism Paint.

Anyway, now I don't even see Rosetta being offered. Are there any other conversion packages out there? And what are the extenders for the files I would need to convert?

Thanks,

Bob

Latest version that I know of is 6.5.5 which I have. Humm, must
be about due for an upgrade. This is NOT the normal AdSCSI utility, but the
PRO version. I have it on my Falcon but I am Not using it to Boot with.
When I need to use it to work on SCSI drives or Host Adaptors, I have to
run the program ICDBOOT.PRG first. It goes out and installs itself and returns
to the desktop. Now because it is the PRO version, everything works just fine.
The AdSCSI version 6.5.5 is NOT the same. The PRO version is only
updateable direct from ICD, not on GEine, not on CServe.

It's a standard RGB output... the kiosks usually use a SC1224 with it.

You are using HSMODEM?

If so, then it could be the cache. Delete everything in it manually,
run Cab, check the max and min cache sizes are not out of range, flush
it then try again.

STIKTSR installs STIK.ACC's cookie. You can however (at least with
MagiC 2.0) run stiktsr.prg from the desktop just prior to running stik
from the desktop.

Message-ID: <cggiles.20.000FB8EF@bradford.ac.uk>
Source record: 147757

I got Protext 6.5 for my IBM PC because I heard it converts Atari ST First Word Plus files into it's own format. Well, it does, but it seems to make every single line into a paragraph. That's little better than converting the files to ASCII.
How can I strip out all those carriage returns? It seems to have a particular problem with 1stWord's hanging indents.

Thanks

Chris

I don't use a USR modem, however...

I assume you have a 28k modem? Your post neglected to say this.(I believe
that USR do 14k Courier modems, as well as 28k)

Have you tried using Serial 2? My Microcom 28k is a bit happier on that
port than Modem 2. (Strange, as both ports [Serial 2 and Modem 2] are
controlled by the same NCR 5380 chip)

Source record: 147762

Hi there.

I've had one of those annoying little problems that is seldom
worth checking into but frustrating nonetheless.

When I am online to most services (internet, BBS, etc.) and press
my return key, my computer seems to send the return signal twice. For
instance, when I start up PINE, I type "pine" at my dollar prompt and hit
<RETURN>. After I enter PINE, there is a second <RETURN> that selects the
first highlighted option. This happens quite frequently.

I use STalker on a 2.5 meg 520st, usually with VT-100 emulation.
I didn't have this problem on GEnie, but that's the exception.

Do any of you have any ideas as to a possible cause and potential
fix for this annoyance?

Thanks in advance.

If I recall correctly, HDX _INSISTS_ that all SCSI IDs used in the system
be contiguously numbered, and that the first device _MUST_ be 0 unless you
are using a Falcon...

I've been reading/posting messages in these newsgroups for years now, you'd
think I'd have started that last paragraph with 'IIRC' huh?

>based 80 MIPS Atari's out there?

The Walker is a 40-MHz EC030-based system that will sell for over $1000,
with literally no sales support in North America, no memory protection.
Pardon my language, but it seems kind of half-assed to me, no match for
a DSP-equipped Falcon030 that preceded it by 3 years.
As for the 060 system, there's no 060-based Atari, but there's an 060-based
TOS system (The Medusa T60), and the HADES incorporates 060 technology and
a PCI bus (something the Amiga has yet to obtain). It will also cost
considerably less than the A4000T/060, and has more professional applications
available for it. So in a nutshell, TOS is doing quite well - it's broken
the chain of dependency on a single hardware-maker, and single OS-programmer.
To see the advantages of this, just go over to comp.sys.amiga.misc, and look
at titles like "ESCOM UK INCOMPETENT!!!!" and "What the hell is AT thinking?"

>I know about the TT and things I definitely don't. If my memory serves
>me correctly, a stock TT030 has/supports:
>
>16 MHz 030

It has a 68030 clocked at 32 MHz and IIRC, FPU.

>But ...
>Can one run 640*400 or higher displays in VGA *non*-interlaced?

Yup.

640*480*16cols is TT Medium

>What is ST vs. TT RAM ? (This machine will come with 2/4 MB)

TT Ram is atari's version of fastram. Only the CPU can touch it - so it
runs programs /quick/.

>What type of RAM chips are used?
>Is the CPU/clock crystal socketted and can be replaced with a faster
>one?
>Does C-Lab Creator/Notator run on it? How about X-Or, Steinberg synth
>editors, Emagic Sound Surfer and Diver?
>Does it have Multi TOS?

Not as standard

>Does Multi TOS offer true preemptive multitasking?

Yep - but AES 4 is cack - AES 4.1 is good, but you can't get hold of it
any more. MagiC 4 is best on most accounts. :)

Yours etc.

David.

283. CAB Bug!

Newsgroup: comp.sys.atari.st
Date: 1996-04-04 00:00:00 UTC
From: nurmix@gateway.ecn.com
Message-ID: <4k2g3l$lmm@gateway.ecn.com>
Source record: 147768

I'm using the current version of CAB (in my case, the version that came after 1.16 but before 1.30 - the betatest version?). Anyway, the actual CAB program is still 1.0 in the version I'm using.

Here's the bug:

For some reason, CAB seems to be deleting about 2/3 of my HOTLIST (including the Themes) or just a few sites for no apparent reason and at no particular time! I'll go to the HOTLIST once, and everything will be there. I go to it 10 minutes later, and suddenly, most of it is gone!

Can anyone offer any suggestions on THIS BUG!??!

If you only get this problem using PINE the solution could be simple.
Check under your ininitial-keystroke-list= (under setup). Erase whatever
letter(s) you have it set on, and this should solve the problem.

You probably know it already, but I'd like to make it clear anyway:
with the little AUTO folder prog ANSI_ST.PRG the Atari gets some
VT100 capabilities that the NOS telnet can work with. With the op-
tion 'echo accept' in the setup I am able to use applications like
pine or lynx on my host which use hotkeys and cursor control.

Just to save the honour of a great, reliable package ... :-)

>however it'd be nice to have them too.... I have already tried High-Rez
>emulators and don't like the job they do, I have also tried an interlace
>programme all in assembly source code... it kept on crashing :(

There *is* a PD util to achieve this, and in all ST modes. I used it on
my STe. Perhaps 320x400 is a little on the 'odd' side, and perhaps the
new ST High of 640x800 is a bit duff too, but ST Medium's 640x400 is
brill! :)

But, (there's always a 'but'!) I cannot remember where I got the util
from! It was just a tiny PRG file that went in the AUTO folder..
I think I got it from a cover disk...?? I'm very sorry I can't remember:(

Try Floppyshop -they usually have everything Atari.

My memory is starting kicking in.... I *think* I may have got a version
from the ST Club. It was part of the Mousetricks v2 package.
Now, whether I used this in my STe days, or the PD one...I dunno. :-(
Give FaST Club a ring anyway....

Steve

In a time where I can buy a 50MHz '060 Amiga for about the same price I payed
for my Falcon? (4Mb)

Nah. Accept it, 16MHz 030 + 32MHz DSP is not fast for a computer of that
price. I was very surprised when I saw that they actually wanted to sell such
a thing. Especially since the TT already ran at 32 MHz (if I'm right).

[oh great -- another Amiga vs Atari war...]

At which cost? And most important: where?!? (In Holland) All Atari shops I
knew have closed business or switched to those (shudder) PC-things.

Does this happen often? Is there a way to see if it's the DSP56001 itself or
the special RAM that goes with it? Are there programs to test the critter?

> A Falcon without a DSP is seriously crippled, think of all those Demos,
> Sound Trackers, Samplers, Games (like Bad Mood) which are unusable !

I'd sure like to get my Falcon up and running again. Using it for word processing only is not really my idea of exploiting its capabilities.

299. HsModem and RSVE Questions...

Newsgroup: comp.sys.atari.st
Date: 1996-04-05 00:00:00 UTC
From: thechyld@pcc-uky.campus.mci.net
Message-ID: <828780172_OASIS_@pcc-uky.campus.mci.net>
Source record: 147661

Okay, I've got HSmodem 6 and the RSVE board installed in my Mega ST4 with TOS 1.4 and an Adspeed accelerator...now, I've got a few questions......

1) I'm using Oasis, so do I set the speed in STARTUP.NOS to 110 (where 38400 is auto-remapped to) or do I actually set it to 38400?
2) Do I need to get rid of the modem.cpx and other serial port "fixes"? (if I keep the modem.cpx, what do I set it to?)
3) If I want to remap 38400 to 300 so that some older programs can use the higher speeds, how do I do it? I read the docs and they say to set the new speed first/old speed but its not real clear in mfp.prg exactly how you do that...?

Oh, BTW, I have a Supra Express 28800 modem....<grin> Thanks in advance for any help! :)

From: Jim DeClercq <jimd1@primenet.com>
Message-ID: <4k3v21$mtf@nnrp1.news.primenet.com>
Source record: 147662

I use Flash 1.6 on a ST, put hsmodem6 in my auto folder, and saw average
z-modem rates, using xyz.ttp, go from about 1200 cps to about 1800 cps,
with Flash set to 19.2, fed to a Supra 28.8.

I am pleased. In the US, one can get the RSVE board from TOAD, for about
$60 US, if even faster transfers are wanted.

Want to talk about sales-support? I don't even know a single address over here
in Holland where I can still get Atari stuff!

And if you want memory protection to be of any use, you first need a multi-
tasking OS. When I run MiNT on my 4Mb Falcon, I notice two things: my computer
becomes dead-slow and has almost no memory left, and over 75% of the
applications I frequently use don't work with it. So: I have to disable MiNT
and *poof!* there goes your precious memory protection.

> Pardon my language, but it seems kind of half-assed to me, no match for

A 030 at 16 MHz is a joke, while a DSP is very nice but a bit dedicated to me.
It's almost as if they expect everyone to go into image/sound processing.

And remember that Amiga's have their custom chipsets as well (albeit less
spectacular than a DSP).

I can't say anything about that. How can you tell?
> So in a nutshell, TOS is doing quite well -
> it's broken the chain of dependency on a single hardware-maker,
This is certainly an advantage ...
> and single
> OS-programmer.

.. but this isn't. More than one OS on an already (relatively) small platform?
Brrrr.

> To see the advantages of this, just go over to
> comp.sys.amiga.misc, and look at titles like "ESCOM UK INCOMPETENT!!!!" and

> "What the hell is AT thinking?"

More "Re: ESCOM UK INCOMPETENT!!!!"'s and "Re: What the hell is AT thinking?"'s really. AT has to make some tough decisions and I (and many others) think they're going in the right direction. If other companies would start producing Amiga's that would be great though.

I had a problem sending files to a friend from Eudora on the IBM
platform. If the person on the mac is using maceudora, tell them to
try encoding with MIME. There is an atari program that will decode
mime. Not sure about binhex.

No I got it to , and it works really well, it supposed to emulated a 286.
Which is not too bad. The only problem is that you can run only
under dos, which is included in softpc, the dosv5.
And it also works with tt family.
Bye.

In article <1996Apr4.052155.20445@lafn.org>
ad910@lafn.org (Bobby Swain) said:-

>I keep hearing wonderful things about Apex Media and In Shape, but,
>from what I can gather from the advertising blurbs, none of them has
>the 3d object creation and editing power of good ole' Cyber Sculpt.

Your right about the power of Cyber Sculpt. I have been using it for
many years now and think it is more powerful than many newer packages
on other platforms. Sadly it was not developed further.
Apex Media is not a 3D model creator. With your knowledge of the
Cyber packages you have probably heard of Cyber Paint. Well, Apex is
a much more powerful Falcon version of Cyber Paint. Basically an art
package with facilities to cope with multiple frames to be played as
animation, like AutoDesk Animator. Cyber Paint and AA were made by
Jim Kent.

InShape is, IIRC, a solid model geometry 3D modeller. That is to say
it doesn't actually use points and faces like CS but uses primatives
and formula to define the shapes in memory. You create the shapes in
ways similar to the CS extrude and spin tools, amongst others.
This method in many ways is more powerful, uses less memory, better
rendering (all the curves are smooth rather than facetted), and more
acurate.
I like the CS method of points and faces, it is a challenge to
generate the most accurate representation of an object while keeping
the face/point count down to a minimum.

>This isn't a statement of fact, just an impression of what's out there
>from someone who is still using the Cyber and Phase IV packages...
>but is looking to upgrade.

I have upgraded to using Phoenix 2 (Xenomorf 2 outside the US) to
give much better renderings. It loads Cyber Sculpt's 3D2 files and
has some compatibility with Chronos.
Phoenix has many extra features. Texture and image mapping, shadows,
transparancy, fog and much more control over output. No more 16
colour limit.
There is another program around like InShape, it's called Neon. There
are demos of theses programs floating around. And of course there is
the ubiquitous POV.

>So where do we get object libraries? Are the Falcon oriented packages,
>Apex, InShape et. al., able to read and manipulate/render objects
>created on other platforms? Once they import the objects, are these
>new programs able to tweak them point by point and face by face like

>Sculpt?

I think, and I stress 'think' because I can't be certain, that Neon
and InShape both could load Cyber Sculpt's 3D2 files. But you will
not be able to manipulate them point by point and face by face. I may
be wrong but each face will be converted into a separate flat 3 sided
object.
Unlike picture and animation formats 3D files don't seem to
have cross platform standards. The nearest I can think of is that
3D Studio for the PC may have converters for Cyber Sculpt objects,
being written by the same fellow (Tom Hudson), though the converters
may be PD software.
Strange how two of the Atari platforms best authors, Jim Kent and Tom
Hudson, went on to write industry standard packages for the PC.

>I'd love to find some FAQ files that could give me an overview of the
>various object file types, and their formats, on all the platforms.

I am sure various files exist outlining the file format of different
pieces of software.

>And most of all, while I'm waiting to win the lottery (at which time
>I be able to afford a maxed out falcon system and all the software
>goodies), Are There Any Conversion Programs To Convert Object Files
>From Other Platforms To 3D2 so I can use them with Cyber and Chronos?

If I won the lottery then I would buy a Silicon Graphics workstation
that is capable that of rendering scenes in realtime that the Falcon
could only dream of doing in weeks, even with megabytes of Fast-RAM
and accelerator boards.

>I got Rosetta from Lexicor, but it didn't work. In talking to Lee Seiler,
>he claimed this was an illegal copy made by a distributor without his
>consent. He asked for the original I had purchased and a copy of my
>sales receipt. Being a good anti-pirate, I complied... but I never got a
>"good" copy of Rosetta back from him. And support and upgrade
>privileges were revoked for Chronos and Prism Paint.

You mean that because you sent them your original disks and receipt
they removed your update rights? That's crazy! It's obviously the
distributors fault. Start writing angry letters to all concerned.

>Anyway, now I don't even see Rosetta being offered. Are there any other
>conversion packages out there? And what are the extenders for the files
>I would need to convert?

The best thing I can suggest is to post a question to some of the
comp.graphics.* newsgroups.

Good hunting. Let me know if find anything interesting.

>>were distributing it and then it suddenly switched to Compo.

>Have you considered the BlowUp-FX option?

I have considered the BlowUp-FX board, and I may yet have one fitted.
But for the stuff I mainly do, 3D rendering, the Afterburner type
accelerator will give a greater performance increase.
I would be interesting in hearing about the actual performance of the
FX board but I would guess that it doesn't double it.
The Afterburner gives around a 20 fold improvement. A 3D scene that
normally takes an hour to render would take less than 5 minutes!

>I heard Gasteiner where still doing an 040 upgrade, but it was £499!! :O

I contacted Gasteiner and they told me that they had no accelerators
for the Falcon.

315. For FREE: Lots o' software (Bay Area)

Newsgroup: comp.sys.atari.st
Date: 1996-04-05 00:00:00 UTC
From: clubok@physics10.berkeley.edu
Message-ID: <4k4ai3$sjo@agate.berkeley.edu>
Source record: 147677

That's right; you heard correctly. I have a BBOS (Big Box Of Software) for the Atari ST, and I am giving it all away for free. This software is all commercial, all original disks, and I think all with documentation. There are games, utilities, and productivity software. Mostly games, I think. To be frank, a lot of it is junk. But a lot of it is good (although classic) software -- for example, Microleage Baseball, The Pawn, and Guild of Thieves. At the very least, sorting through the games will give you weeks of entertainment. It did for me, and I only ever tried a fraction of them! I don't think I would be exaggerating to say that there are hundreds of titles here.

Now you are probably wondering, who is this Ken fellow, and why does he want to give me all this software for free?

About a year ago, a fellow on c.s.a.s. was selling his entire software collection. I put in an offer, and ended up with the whole thing. I was a little surprised when the shipping ended up costing $35, but stupidly didn't think anything of it. When the box came, it was HUGE! I had lots of fun going through a bunch of the games, although I never had the time to look at all of them, and I wasn't terribly interested in the utilities or productivity software. Anyway, I think the enjoyment I got out of it was well worth the money.

But now I am graduating and moving back east. I am getting rid of my ancient 1040ST, and finally getting myself a PC compatible. On the other hand, I have been an Atari owner for about 15 years, and I feel a good deal of loyalty to the Atari community. A lot of the software in this box is no longer available, and it would break my heart just to throw it away and take it out of circulation forever (even if much of it is junk). But I really don't want to bother selling the lot, and I especially don't want to bother shipping this huge thing.

So here's the deal: Anybody who wants this huge (although old) software collection can have it -- first come, first serve. There are only two conditions:

1) You must be able to come to my apartment and pick it up. I don't want to ship it, and I don't have a car. For this reason, only people from the SF Bay Area would probably be interested. (I live in El Cerrito.)

2) You must promise that when you are done with it, you will make an effort to keep the software (original disks, that is) circulating in the Atari community. I don't care if you break up the lot, if you give it away like I am, or if you sell it piece by piece. I just want you to make every effort to find homes for the disks before throwing them out.

OK, now who's interested?

>From my understanding, the Walker will be priced under a $1000. Still alot for
>an 030 box.

Wrong. The official exhange rate puts the Walker at over $1000 US. Assuming
that AT will choose to make a US version available, there have yet to be
ANY US A1200s made by them. . .

>TOS is doing well? I don't see TOS showing up on marketshare charts..

And I see Apple shrinking rapidly on the marketshare charts as well. Of
course, if you're one of those business-oriented radicals who values utility
over unit sales, this doesn't faze you for either Mac or TOS. Suffice to
say that the TOS producers are doing OK.

>Where can you get a HADES and Medusa? The Amiga has sold more units than TOS..

I can order one from any TOS mailorder place that has decided to make them
available.

The Commodore 64 has sold more units than the PowerMacintosh. . .

>becomes dead-slow and has almost no memory left, and over 75% of the
>applications I frequently use don't work with it. So: I have to disable MiNT
>and *poof!* there goes your precious memory protection.

That's MINT. What about MagiC and other multi-taskers? What if you want
protected processes to exist under Linux? This memory protection isn't
"precious," in the Amiga, a machine that preaches a creed of multitasking,
not having memory protection in the computer is like selling a car with
twin-turbo V8 and economy shift gearing.

>A 030 at 16 MHz is a joke, while a DSP is very nice but a bit dedicated to me.
>It's almost as if they expect everyone to go into image/sound processing.

Sure, alone, the 030/16 is a joke. But combine it with the 56001, and it
blows the doors off the Walker. As for image/sound processing, this is not
the only option on the Falcon - it is pretty much the primary option on the
Walker, since no professional applications exist due to the Amiga's
historically crappy display refresh rate.

>And remember that Amiga's have their custom chipsets as well (albeit less
>spectacular than a DSP).

Yep, AGA in 256 colors with HAM8 fake enhanced color, at a lower quality and
update than the Falcon's VIDEL. A bus that plays 8-bit sound in stereo, vs.
the Falcon audio bus with 16 bit CD-quality D2D sound. The list goes on
and on. In every area that Amiga users claim superiority in, the Falcon
has them bested by several orders of magnitude.

>I was talking about a A1200 + Phase5 expansion card, giving you a full
>060/50MHz for $1050

Try buying an Amiga 1200 in North America and Australia/New Zealand. Now,
try buying a Falcon030 or C-LAB machine. Which is easier? The A1200
still retains the 7 MHz system bus, the AGA chipset, and the limited
sound capability. And a Phase5 board including 060 for $1050 seems
a conservative estimate to me, let alone a new A1200 along with it.
Here in New England, it runs at about $1400 unpopulated.

Hi every one, I saw an interesting question on a french newsgroup,
and I don't know myself, so I'm asking you.

This guy has a falcon tos 4.01 . He has a internal IDE HD and a IDE CDROM.
He also has a cable to connect everything internally.
He can't get the cdrom recognize, even with metados or scsitool.(which is a
previous version).
So is it possible to have an IDE cdrom drive working with the internal HD
IDE, together?
Thank you in advance.....
Bye..

I get that at the stage where auto and accs have loaded but during
MagiC's auto\apps\ list. There is a conflict in my setup somewhere.
Very rarely do I get a conflict except in low rez, so I reckon I've
got a rogue program somewhere, possibly a CPX but I use low rez so
infrequently I can't be bothered to sort it out.

>afford a SLIP connection, and just want CAB for viewing stuff offline.
>MiNTnet folks will like this also...

Once the language translations for the setup program have been
completed there will be a separate release STiK+Config. The other
components are available separately now.

Yes, it's huge and the setup program is responsible for most of that.
For a plug 'n' play solution this can't be avoided, it will inevitably
grow as more providers are added.

Look in the setup\ folder docs. You will find if you don't need it you
can drag the whole thing to the trashcan or off to a floppy without
affecting any other components. In fact, dragging the setup\ folder
off to a floppy and running it from there was a consideration right
from the start - who the hell wants an installation program sat around
wasting space?

Moreover, you may have noticed that the setup program sets itself up.
At the expense of more initial disk space, it allows you to remove
those sections which you do not or no longer require, resulting in
less final disk usage. A perusal through the beta_doc\ folder docs
will give you a good idea how to strip out most of the setup code
whilst still leaving yourself with a plug 'n' play solution.

Dungeon Master was released for the IBM/Tandy sometime in the late 80's. It says it requires DOS 3.3, works on EGA or VGA, supports mouse, joystick, Sound Blaster, Ad Lib, and has an FTL sound adapter which lets you plug a joystick into the PARALLEL PORT of the PC, and also pulls off an audio signal that you can route to a Stereo. The sound adapter came separate from the game, but I believe every package had the extra box shrink wrapped to it (at least every box I have ever seen in stores had it). The picture on the back of the box was "images taken from Atari 520st". What the heck was that <g>

>Isn't it both VGA + RGB? Best of both worlds on the Falcon!
>How come you didn't ask when buying? :)
>
It wasn't actually 'me' who bought it, but a friend, and yes he did
ask, but since buying it other catalogues have turned up ,suggesting
it isn't what it was sold as.... and so he is unsure as to what it is.

The real problem isn't now but later if as he is considering at the
moment he gets something like Blowup FX, which includes a screen
expander.

I had a similar problem with CAB only downloading like 4660 bytes of an HTLM page and it was solved by turning on the hardware flow control. I think also installing HSMODEM will solve the problem.

Hopes this helps...

>The "formtting" on a new SCSI drive is low-level, Sid. In order to use the
>drive, is must still be high-level formatted so that your OS knows where to
>store things.
Sure, but that is done by a partitioning program, not by a harddisk
formatter. Such a "high-level formatter" only writes out a couple of
sectors (rootsector, (logical) bootsectors, FATs and root directories),
whereas low-level formatting affects the whole drive and therefore
needs much more time.

I'm not going to say that you don't know that difference, Rich, but
most people asking for a harddisk formatter actually want a low-level
formatting tool, as HDX tries to low-level format drives before you can
install partitions on it. Since all harddisks currently available come
fully low-level-formatted, there's no need to do so a second time.
Simply install the partitions, and off you go.

Ciao

333. Selling ICD Hard Drive Adapter for the ST - US$40!

Newsgroup: comp.sys.atari.st
Date: 1996-04-05 00:00:00 UTC
From: cb092@FreeNet.Carleton.CA
Message-ID: <4k36s7$joo@freenet-news.carleton.ca>
Source record: 147695

Looking for an affordable hard drive solution for your
Atari ST? I'm selling an ICD Hard Drive Adapter to go
with an Atari ST (520, 1040, Mega ST, etc). Install
this adapter in an external HDD case, hook it up to
a run-of-the-mill SCSI hard drive of any size you like.
Connect the other end to your ST via a cheap Atari
HDD cable (you don't need an expensive "LINKII") and
voila! you are in ST hard drive heaven.

I'm selling this ICD ST hard drive adapter (with SCSI
hard drive software for the Atari ST) for US$40, shipped
anywhere on the planet. You can't go wrong for that.

Regards,

Keith M.
cb092@Freenet.carleton.ca

I'm having the same problem with CAB. It seems to want to loose 2 entries
for every new entry I try to add to the hotlist. This is very frustrating,
cause half the time you want to save a URL because you cannot remember
how you found it in the first place. Then CAB starts loosing them. ;(

Anybody have a fix for this?

Not trying to flame, but could you describe what exactly the main advantages
are of TOS, compared to other OS's? I know what TOS is (a bit), I have
programmed a little with it in GfA, but I honestly don't see what's so great
about it.

340. SoftPC on Falcon under Geneva! READ THIS!

Newsgroup: comp.sys.atari.st
Date: 1996-04-05 00:00:00 UTC
From: afn14016@freenet.ufl.edu
Message-ID: <4k2abo$qir@huron.eel.ufl.edu>
Source record: 147781

Hi Friends: I have great new for you all. As I am writing this letter
I ahve geneva and neodesk loaded in my Falcon 030 16 megs runing on
my computer.

I also have loaded into geneva STalker which is now dialing the
internet as I try to upload this document to comp.sys.atari.st.

Also I have loaded Steno which is what I am using to write this.
The most incredible of all is that I have Loaded SOFTPC program
and loaded in it is the IBM programCalendar Creator plus which is
ready to print a nice Calendar!

So all toguether I have loaded and going:

SoftPC
Dos 3.03
Calendar Creator Plus (IBM PC)
Geneva4
Neodesk4
Kobold
Steno
and Stalker Dialing and ready to connect!

Well, every day I feel more and more happy and furtunate to have
an Atari Falcon. With this kind of impressive performance the
Falcon proves that it is really an amaizing computer :-)

Lets talk about softPC now:

I got the softPC file and unzipedit to partition C:

Oh. wait I am connecting now......I am connected and will use
"talk" feature to talk to Katherine Ellis for a while before I
post this!

Ok, I am back after a 15 minutes talk! and I am still running
every thing :)

so, I got the folder SOFTPC on C:
and copied the file C_DISK.HDF to partition C

I booted the computer with Jar10.PRG in the Auto folder and
NVDI. in 16 color mode 640x480.
then, I run the PCRUN.PRG and it took abou a minute for the
program to load.

At that point I had a dos 3.03 disk in drive A and DOS loaded.
I most tell you that I noticed that the GEM menue was still

available as well as the ACC's so that is why I decided to
experiment and run it from Geneva.

I set the PCRUN.prg As single tasking to avoid troubles.

Ok, so DOS loads fast and the screen is in color. I run some
programs I run on PC Ditto and they are way fast!

Also, I feel that running the Calendar Plus is a good test as It
takes about 30 minutes to decompress as it is installed.

I got an IBM friend who gave me the program and he says it does
take time in his computer as well.

any way, I having runing this thing for two hours now and not a
single crash!

The SOFTPC installation was as simple as I said. You can
congigure the drives on a GEM . Simply go to the far right menue
and select drive D and select create a drive. I created a drive
on partition I and gave the path name I:\DATA and the space for
it 5 megabytes. That was all, I then run the installation for the
PC program etc.

I also was able to run IBM programs from disk. I had had this
gGISMO gor 2 1/2 hours and it is impressive.

If you havea Falcon GET IT! IT is on the POWER CD from Compo and
Toad has it for $34.oo

I do not know about you , but I am impressed with this Falcon 030
and SoftPC combination and I wonder how it will be with an 040!

I hope you found this useful. Raymond

St's send CR LF when you press RETURN! UNIX use just a LF and
will interpret a CR LF as 2 LF, lucky for me I don't have to use the UNIX
shell as my ISP has a menued setup also! Might try Teddyterm2. I don't
have your problem except when I upload a file as ascii to an online
editor! Fix for that is to sue the LF only option when saving in Everest
or run that simple program that converts CR LF to LF (I forget the name
of it) Might not help, but at least you know what the problem is now!

From my understanding, the Walker will be priced under a $1000. Still alot for
an 030 box.

TOS is doing well? I don't see TOS showing up on marketshare charts..
Where can you get a HADES and Medusa? The Amiga has sold more units than TOS..

Hi everyone.

My friend needs a program called Blueterm. It's apparently a fix for the
problem of a big screen monitor turning 'blue' after quitting some programs.
I think it's an older program and was shareware.
If you have it or know where I can find it, please let me know.

Thanks in advance.

Julian.

345. Files from FTP.toad.net don't work

Newsgroup: comp.sys.atari.st
Date: 1996-04-05 00:00:00 UTC
From: ab078@sfn.saskatoon.sk.ca
Message-ID: <4k2jrc$30u@tribune.usask.ca>
Source record: 147786

I have recently started doing anonymous FTP requests by E-mail from
FTP.toad.net. I've found that approx. 50% of the files I get from there
seem corrupted in some way. By corrupted I mean sometimes after I
DE-uuencode them and then try to decompress them I get "CRC failed"
messages. Also, sometimes the computer crashes with 2 bombs as soon as I
select "Extract" in the archiving program. Sometimes the files do
uncompress OK, but then when I try to run them the computer crashes
also.
Some of the files that did NOT work are:
38400bps.lzh
1stmaths.lzh
bodyshop.lzh
dot2dot.lzh
fouryrs.zoo
kong.zoo
outline.zoo

Some of the ones that did work are:
trains.zip
bellum.lzh
dandy.zoo
mouspeed.arc
buttnfix.lzh

I am using Flash 1.6 with Zmodem
ESS-code 6.3
DC Extract Plus 2.06
ST Zip 2.6
Supra Modem 2400

Has anyone else had problems like this? If not, can you offer any
suggestions? Thank-you.

346. Re: SoftPC on Falcon under Geneva! READ again!

Newsgroup: comp.sys.atari.st
Date: 1996-04-05 00:00:00 UTC
From: afn14016@freenet.ufl.edu
Message-ID: <4k2och$rr1@huron.eel.ufl.edu>
Source record: 147787

I hope this one makes more sense as I really was typing fasT!

Hi Friends: I have great news for you all. As I am writing this letter
I have Geneva and Neodesk loaded in my Falcon 030 16 megs running on
my computer.

I also have loaded into Geneva STalker, which is now dialing the
internet as I try to upload this document to comp.sys.atari.st.

Also, I have loaded Steno which is what I am using to write this.
The most incredible of all is that I have Loaded SOFTPC program
and loaded in it is the IBM program calendar Creator plus which is
ready to print a nice Calendar!

So all together I have loaded and going:

SoftPC
Dos 3.03
Calendar Creator Plus (IBM PC)
Geneva4
Neodesk4
Kobold
Steno
and Stalker Dialing and ready to connect!

Well, every day I feel more and more happy and fortunate to have
an Atari Falcon. With this kind of impressive performance the
Falcon proves that it is really an amazing computer :-)

Lets talk about softPC now:

I got the softPC file and unziped it to partition C:

Oh. wait I am connecting now......I am connected and will use
"talk" feature to talk to Katherine Ellis for a while before I
post this!

Ok, I am back after a 15 minutes talk! and I am still running
every thing :)

so, I got the folder SOFTPC on C:
and copied the file C_DISK.HDF to partition C

I booted the computer with Jar10.PRG in the Auto folder and
NVDI. in 16 colors mode 640x480.
then, I run the PCRUN.PRG and it took about a minute for the
program to load.

At that point I had a dos 3.03 disk in drive A and DOS loaded. I most tell you that I noticed that the GEM menu was still available as well as the ACC's so that is why I decided to experiment and run it from Geneva.

I set the PCRUN.prg As single tasking to avoid troubles.

Ok, so DOS loads fast and the screen is in colors. I run some programs I run on PC Ditto and they are way fast!

Also, I feel that running the Calendar Plus is a good test as It takes about 30 minutes to decompress as it is installed.

I got an IBM friend who gave me the program and he says it does take time in his computer as well.

Any way, I having running this thing for two hours now and not a single crash!

The SOFTPC installation was as simple as I said. You can configure the drives on a GEM . Simply go to the far right menu and select drive D and select create a drive. I created a drive on partition I and gave the path name I:\DATA and the space for it 5 megabytes. That was all, I then run the installation for the PC program etc.

I also was able to run IBM programs from disk. I had had this gizmo for 2 1/2 hours and it is impressive.

If you have a Falcon GET IT! IT is on the POWER CD from Compo and Toad has it for $34.00

I do not know about you , but I am impressed with this Falcon 030 and SoftPC combination and I wonder how it will be with an 040!

I hope you found this useful. Raymond

Hi Raymond,

What type processor does SoftPC emulate? (8086)?

Thank's,

Mike

351. STik/CAB/MGFTP/Antmail/Forcast all work fine here :)

Newsgroup: comp.sys.atari.st
Date: 1996-04-05 00:00:00 UTC
From: Michael Grove <mgrove@owens.ridgecrest.ca.us>
Message-ID: <DpDxD5.DB0@ridgecrest.ca.us>
Source record: 147792

The installation program makes STik pretty painless to get going.
The only thing I had to edit was one of the prompts my server
makes (it was to long to fit into the auto configuration menu).

CAB works better than ever. Still had to add the file 00000001.htm.
in the cache folder. No crashes so far.

MG FTP is weening me from the PC. This is working really nice.
I don't think this ever bombs.

Ant Mail took a few tries to get set right, but if I would have read
the instructions, it probably would have worked the first time :).
Is way faster than logging on with the PC and starting Eudora.
I'm sold.

Check's in the mail guys. (Ok, on Monday).

Peep, Peep, how can I do newsgroups? (TOS and GEM).

Thank's

Mike

352. NeoN Grafx in english for TOS yet?

Newsgroup: comp.sys.atari.st
Date: 1996-04-05 00:00:00 UTC
From: Michael Grove <mgrove@owens.ridgecrest.ca.us>
Message-ID: <DpDxI7.DDM@ridgecrest.ca.us>
Source record: 147793

I tried posting this through my server at work, but don't see it now,
so I will ask again.
I have seen that NeoN is available for O/S 2 now, but was an English
or even German version ever released for TOS?
If so, where do you get it?

Thank's

Mike

Fully compatable. Ice does not set the modem port in any way it just
uses it at whatever it is set at.

354. FS: (UK) External DD Floppy

Newsgroup: comp.sys.atari.st
Date: 1996-04-05 00:00:00 UTC
From: Steph@wuss.demon.co.uk
Message-ID: <828796492_OASIS_@wuss.demon.co.uk>
Source record: 147795

I've got a Cumana DSDD Floppy drive sitting next to my 'pooter here, and it is now redundant. Why? B-cos I am getting a shiny new SyQuest! As I rarely use floppies except to back up, this drive needs to go to make space for the SyQuest & to fill a hole in the bank account.

Of course, I am interested in a trade for it too :o)

Here's what I'd like:

MagiC 3 or 4 (Surely someone must hate it? Or bought a new version?)
Ease 4
Papyrus Gold 3
Twist 2 or 3
Extendos Pro 2.2
HD Driver 4.5

Heh. I don't want much, do I? But I will add to the value of my end by giving you:

a. Some Floppy discs. In fact, lots of floppies!
b. Some games software. e-mail me for a list if this tickles your fancy.
c. Some cash (OUCH!)

If you just want to buy the damn thing, send me an offer. I'm a reasonable man. I'll take anything, really!

Steph.

355. Advice needed: CD/EZ/SCSI

Newsgroup: comp.sys.atari.st
Date: 1996-04-05 00:00:00 UTC
From: Steph@wuss.demon.co.uk
Message-ID: <828797072_OASIS_@wuss.demon.co.uk>
Source record: 147796

Hi folks.

I need some help with a SCSI related problem. Here goes:

1. I have a MiniS hard drive & the ICD Link II host adaptor. Am I right in thinking that I need 50-way to 50-way scuzzy leads?

2. I am getting a nice new SyQuest EZ 135 drive. Are they easy to set up/use? Specifically, are they easy to format & partition? Can you change cartridges on the fly, or only while the 'pooter is powered down? How reliable are the cartridges for backup purposes?

3. I have acquired a CD-ROM drive from the school I work in. The bugger has no cables, no info, and damn little in the way of switches & buttons. It is a scuzzy, so that's ok. It is made by Cumana. What I need to know is can I connect it to the chain of SCSI devices mentioned above? What software do I need to run it? I know about Extendos Pro, but I don't want to throw 30 quid down the toilet if I can't get this to work. Is there a shareware equivalent that doesn't require MiNT? Or even a freeware demo of Extendos? If so, can someone tell me where to find it/them?

4. Assuming I get my CD-ROM working, is there any way I can spurt digital data direct from the drive to memory without using sampling software? What I want is some high quality samples from CD. The data is there as digital data already. So why sample?

5. I'm looking for a CD full of stuff. Mainly picture files (GIFs or IMGs), sound files (samples), fonts (for NVDI - TrueType) etc. Programs too, I suppose, but they are less important. Money is tight after the purchase of above items, so I am looking for a second hand copy. Anyone got one like this that they'd part with for a small sum of money?

Thanks for any help that can be offered.

Steph.

362. RE: SoftPC on Falcon under Geneva!

Newsgroup: comp.sys.atari.st
Date: 1996-04-05 00:00:00 UTC
From: afn14016@freenet.ufl.edu
Message-ID: <4k3k0m$8j1@huron.eel.ufl.edu>
Source record: 147803

Hi

What type processor does SoftPC emulate? (8086)?

Thank's,

Mike
Hi Mike: acording to a friend of mine who has a Pentium and has had all kinds of PCs ,this baby is about a 286 or faster.

I wonder how it would be if someone gets it to use the DSP if possible or
how it would work with an 040!

PC Calendar Plus is a big program And i run SoftPC from about 7:00 PM to 6:ooam with no problems of any kind. The program is solid.
Raymond

I know I am answering my own question here but there is a reason :-)

>In the new version of CAB I can't load the pages back in from the Cache
>folder (when off line) by entering the address on the URL line or by using
>the Hotlist address anymore. I used to be able to do this with the old
>version of CAB because this was the only way to be able to view the pages
>again with the Images being loaded. You can of course use the load local
>but you don't get the Images.

Just after writing the above I found out why. In this new version it says
somewhere that the CAB OVL is only loaded when STIK is enabled or on
line,so after enabling STIK I could then re load from the CACHE with
pictures loading as well :-) In the old version you didn't have to have
stik enabled, but I know now :-)

BTW,printing with Speedo works,haven't tried with Images yet though.
I also have been on line ,on and off for about an hour or so without a
bomb in sight.
I did visit the Hensa WEB page (a link from some one elses page) and it
loaded OK but when I tried to get a file it kept reporting that it
couldn't get it and seemed to be looking in the Cache on my drive for it
or something ! Could it of been if Hensa was busy and it wasn't allowing
access like it does when there's to many FTP'ing to it ?

>are of TOS, compared to other OS's? I know what TOS is (a bit), I have
>programmed a little with it in GfA, but I honestly don't see what's so great
>about it.

Nothing really, Originally Atari was going to use CPM-68K for the ST's OS,
but they found it was too slow, so they quickly produced an OS that was
internally based alot on MS-DOS. Instead of a command line, they added
Digital's GEM environment. It generally works better than MS-DOS, and
seems a bit more stable thatn Windows though. (But that's not saying much)
I've used it for 9 years, the best compliment I could give it is that
it doesn't get in your way like some other OSes do.
But just to show that it isn't great, look at all of the stuff that
replaces or patches TOS: Replacement Desktops, replacement graphics routines
(NVDI, WARP 9, etc), HSMODEM patch, Multitasking Replacements (Geneva, Magic)
File selector replacements. The list goes on.

Thanx Paul, that would be very handy. I haven't spotted it at IC or on any
of the Umich mirrors. If you could send it I would be grateful.

>Not exactly but a hell of a lot of Accesories will also run as
>programs so just boot them when you need them.

Right, That is worth a try as well but it is handy to be able to call them
from within programs. Some accessories work on the open window (word
count etc).

This used to happen to me back in the 1.0 version. As soon as the first beta
came to me, this problem went away. The current version, the one in WWW130,
is very good, very stable. Get it now.

Steph.

372. Re: Gemulator questions

Newsgroup: comp.sys.atari.st
Date: 1996-04-06 00:00:00 UTC
From: yuvoodoo@aol.com
Message-ID: <4k5lkf$5vh@newsbf02.news.aol.com>
Source record: 147613

I also have a Pentium (P-100) and also recently obtained a Gemulator. V4.15 (most recent version) does not support joysticks as of yet. I'm pretty
sure it doesn't support MIDI either, though I don't have any MIDI apps to test.

However, both of these options are available from the program's configfuration so
they'll probably be added in the next release ot two.

Currently, I have been unable to hear sound from the emulator and I have a properly
configured, stock Sound Blaster 16 installed!

Other than a few glitches in the color mode emulations when using the various paint packages for the ST (i.e. Art ST, Crack-Art, and HyperPaint) the emulator
works well.

I'd say its around 90% compatible with the programs I have. It can even run many
PD and Shareware games but w/o joystick support it its unsuitable for this.

As far as speed goes - it is very fast - several Bench marks rate it at around 3-4 times the speed of an ST...

I find that disk intensive programs and text/graphics intensive programs show
the greatest speed emulation - heavy processing oriented programs like Archivers and image manipulation programs seem to be the slowest.

All in all, I think it was a godd buy and it will become even more valuable as it
is improved.

Ari

I don't think it's possible. IDE CD-ROM drives are actually E-IDE (enhanced IDE), the same thing that allows you to have IDE hard drives larger than 540mb, among other enhancements.

The Falcon was released way before EIDE, so I really doubt it'll work.

* Amiga CD-ROM games software compatible with any
CD-ROM system = CDTV/CD32/other CD-games that works
with e.g. SCSI drive equipped OCS/ECS/AGA -machne.
(A=all machines,AGA=AGA machines)

The Labyrinth of Time - EOA A Pinball Fantasies CD32 - 21st C. AGA
Liberation - Mindscape A Superfrog - Team 17 A
Syndicate A?

* CD32/CDTV/CD-ROM titles compatible with Amiga Zappo/Overdrive
PCMCIA CD-drive, that is able to emulate CD32 on A1200.

CDS THAT DO WORK:
Arcade Pool, Banshee, Beavers, Brutal Sports Football, Bubba 'n' Stix,
Bubble & Squeak, Castles II, Chambers of Shaolin, Chaos Engine,
D/Generation, Deep Core, Disposable Hero, Donk, F-17, Fire & Ice,
Fly Harder, Fu)ry of the Furries, Guardian, Gunship 2000, Heimdall 2,
Humans I + II, International Karate, James Pond 2, John Barnes European
Football, Labyrinth of Time, Legacy of Sorasil, Lemmings CD32,
Liberation, Lunar-C, Mean Arenas, Microcosm, Morph, Naughty Ones,
Nick Faldo's Championship Golf, Overkill, Pinball Fantasies,

Ryder Cup Golf, Seek and Destroy, Sensible Soccer International,
Seven Gates of Jambala, Sleepwalker, Striker, Summer Olympix,
SuperFrog, Super Methane Brothers, Surf Ninjas, Total Carnage, Trolls,
UFO: Enemy Unknown, Ultimate Body Blows, Whales Voyage, Zool I&II
Syndicate

CDS THAT DO NOT WORK!
Alfred Chicken, Brian The Lion, Cannon Fodder, Chuck Rock I+II,
Dennis, Impossible Mission 2049, James Pond 3, Lost Vikings,
Manchester United, Nigel Mansell's World Championship,
Pirates! Gold, Project X, Sabre Team, Sensible Soccer,
Simon The Sorcerer, Shadow Fighter

Anything else you want to be listed? Just suggest it to me,
but if I like it, then _be prepared_ to give me a healthy
collection of names for it.

Help needed with Atari ST/Falcon software. Many of titles
above exist for it too, but I have no information which
include modem/cable options on ST versions too. Therefore,
I shall not mention ST on them, unless I have clear
verification from an ST user.

Want to help me with the lists? I could use someone
with co-author, collecting software titles for those lists
with me, so the updates would be more complete and
happen more often. Co-author MUST have E-Mail.

All lists are updated more or less regularly, depending how often
I come across new list-worthy items myself, or anyone cares to
report them to me. I can be contacted at several sources:

!! E-Mail: jkauppin@muikku.jmp.fi !!

IRC: "Grendel-B" (#Amiga, #C-64)
FINNS ONLY: BBS Neuvosto-Savo 977-1525280/1525281/1525282
FINNS ONLY: MikroBITTI BBS "MBnet" as "Jukka Kauppinen"

Internetters : PLEASE USE E-MAIL!

Please be active and report any mistakes and additions. I can't
personally find everything, but would like very much help the
computer community and games freaks with as complete list as
possible.

This list is freely distributable, and I encourage everyone to
do so - but please also mention the Version-number. Suggested
filename : GGLxx.* (LZH or TXT, please). xx for version number,
like GGL21.TXT. Thanks!

There is the minixfs file system for MiNT/MultiTOS/N.AES. Should be
available everywhere. You need an empty partition to install it, AFAIK.

I have had this problem with the new version as well. The number of bytes
differs but from time to time CAB stops loading (esp. on jpg's as I
noticed). And I've got HSMODEM installed.

I did not have this problem with the www116-package.

Have you heard of Scala? Blows away anything on the Falcon. Plus the Walker
will have a inexpensive PPC card that will blow the plastic case off the Falcon
with DSP..

But, your better off buying a Bebox that puts the Falcon to shame..

Sheesh... $999 gets you a PowerMac 7200/75. The PM will run all the great apps
that are not available on the Amiga and the Falcon..

>> BTW, how much will this new Amiga060 be?
>It's not new, it's with us for quite some time now. $1050. The Walker is a

If you're talking about the Amiga 4000T/060, it has been around for
quite a while. It is an AGA-based, 8-bit sound system running a 68060
and retails for $3,500. It can be purchased for about $2,700. That's
quite a ways from $1050. To add some info, the A4000T price given
above is for an 8 meg unit without hard drive, and is the CHEAPEST
I've found yet for my Amiga systems clients. Most, after seeing these
prices, switch to Macintoshes. I've even switched two very small businesses
over to Falcon after they saw these prices, and after showing them the
inherent advantages of running Calamus, Papyrus, and other productivity
software over the highly inadaquate Amiga stuff. . .

>> That's like putting a Ferrari's engine inside a Ford Escort! At the end of
>> the day, it's still an Amiga -a poor excuse for a computer. So ner! ;-)
> ^^^^^^?
>Why do get the same feeling when I _try_ to do something useful under MiNT?

Because it's MiNT. You know MiNT = MiNT is Not TOS. Try MagiC, Geneva, or
another mulitasker. Or even (GASP) use single-TOS. These are the dominant
systems anyway. And if by MiNT, you mean MultiTOS, the component slowing
the system down here is the MAES, not the MiNT module. A newer version of
the AES is now available, and greatly speeds up operations.

>And I'm talking about a plain A1200 with a Phase5 1260 in it.
>Admitted, it's very plain, but so was my Falcon when I bought it.

Ah. . . so we find here the answer. Basically, the wonderful $1050 Amiga
is an A1200 (a machine not available outside of Europe) running a plug-in
accelerator card, which certainly alone costs more than $1050 here in the
States, not including the additional cost of the A1200 (if you can find a
used one). Truly a viable machine when matched against a Medusa T60.
Tell me another one. . .

>I still think that my A1200 with a 15MHz 68EC020 gets any job done faster than
>my Falcon, except for DSP stuff (and that ain't much). Just because the OS
>isn't as lame as MiNT, but /really/ multitasks and with almost 0% overhead.

That assumes that productivity software for the A1200 is as good as that for
the Falcon, which simply isn't the case. I know, I've done consulting for
Amiga kit businesses before, and the productivity stuff is simply inadaquate.

I'm glad AmigaOS isn't as slow as MultiTOS. However, MagiC and Geneva both blow it away in resource usage, ease of use, and support available in North America. As for the "DSP stuff," I'm surprised an Amiga user would admit the Ami's inferiority in multimedia. This is the last niche that Amiga users attempt to claim superiority in - that an Amiga is the best multimedia platform. DSP-based software like APEX Media even puts those lame arguments to rest, quickly and quietly (unless you're using the Falcon's internal speaker to play the music) :').

>MiNT is "a poor excuse for" an OS. ;-)

I'm glad you think so, since it isn't an OS, and the slow part of MultiTOS isn't MiNT in the first place.

>Have you heard of Scala? Blows away anything on the Falcon. Plus the Walker
>will have a inexpensive PPC card that will blow the plastic case off the Falcon
>with DSP..

One of my clients, who does multi-media work in his spare time as a part-time
business, recently switched from an Amiga 1200 running SCALA and an 030
accellerator to APEX Media, running on a stock C-LAB Falcon. His motivation
was simply running the APEX demo on my machine!

As for the Walker, it won't be available with PPC for quite a long while
(if it's even avilable in North America). As for the PPC card, the Eagle
is capable of using one as well. Of course, the OS needs to be recompiled,
as well as numerous applications. AT doesn't seem to keen on doing either,
at least for North American availability. And plus, the PPC Walker
will cost more than an Eagle. Right now, me and my clients are looking
at what's available - an the Amiga still doesn't cut it.

>But, your better off buying a Bebox that puts the Falcon to shame..

Hmmm. . . let me see, I think I have $4,000 for the unit, $600 for the
100,000
for the custom consultant to develop some software for the OS lying
around here somewhere. . . :')

Incidentally enough, using your logic, the Walker and BeBox blow away the
and AT! I bet they're
quaking!

Amiga Technologies: The company that had to be petitioned by hundreds of
users to make an English-language WWW page on their site, but is "totally
committed" to the North American market!
-
Be, Inc.: The company with great technologies, and no plans to make them
for consumer consumption for years! See www.be.com for more information
on this strange approach

Linux for the Amiga happily uses the MMU if there is one. Memory protection
and resource tracking will (most probably) be in AmigaOS 4.0. If it's not, I'm
going to raise hell somewhere. :-)

405. Falcon/SVGA problem

Newsgroup: comp.sys.atari.st
Date: 1996-04-06 00:00:00 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <RZBJ+W3.lmcclure@delphi.com>
Source record: 147646

Today, I took the plunge a purchased a color monitor for my Falcon030;
a Hewlett-Packard 14" multiscan. (That's no mistake, I do indeed
mean HEWLETT-Packard, not Packard-Bell).

I met with disappointment after the system booted up and reached the
desktop, as their was some slight unstable "tearing" of the graphics
across the upper part of the screen where the icons were. Dropping down
the menus, especially those closer to the center of the screen, or large
dialog boxes, such as the system file selector increased the effect.

Naturally, I expected I had a defective monitor, as when I plugged the
old monochrome VGA I had been using back up, the Falcon's display was as
stable as a rock.

When they tried out the HP on a Compaq at the store, however, it exhibited
nary a problem.

Bringing it back home, I tried various color combinations (i.e., deleting
all reds from the palette, all blues, etc.) in an effort to make certain
it was not the output of a specific signal causing the problem (which
seemed reasonable, as the mono VGA monitor only responds to the green
output). None of the combinations cured the problem. Lowering the
resolution made the problem less pronounced, though testing the 640x480
desktop with fewer colors (I was using 16) seemed to indicate this had
more effect than the actual resolution.

Has anyone else with a Falcon run into similar problems while using a
SVGA color display?

At this point, I have a display I really cannot use (at least until I
get a SVGA card for my old 386sx-25), and no reason to believe another

I had this happen just the once with some combination of beta test
files, I've no idea which versions of what I was running at the time
but I'm fairly sure it was a Cab with debugging wired in. It stuffed
everything that was not in the miscellaneous theme.

>Can anyone offer any suggestions on THIS BUG!??!

Possibly, I had written quick and dirty utility to scan a text file
and insert urls into hotlist.htm 'cos I'm too lazy to type them in.
This utility is not very intelligent, it inserts urls which are
already present and is none too clever at finding the end of an url.

It will find http://fred/jim in some text but also inserts the
trailing period in http://fred/jim.

If this was the cause of my failure (and I don't know it was), perhaps
something corrupt crept into your hotlist prior to it being wiped?

Just a thought. :-)

>I could post a question in the demon support group, if no-one round
>here can help !?

There are strict rules concerning setting up a group. I remember
seeing the text months ago, probably a FAQ - Demon is sure to have it
and demon.ip.support would be the place to ask.

The little I remember is you have to elect/decide on a moderator who
then has to post a document to somewhere stating the purpose and rules
for the group. Then there's a period where people get the chance to
argue via the moderator about it. After that, the moderator has to
summarise then there is a vote. If the vote is successful then the
moderator can go about asking someone to actually create the group.
Takes a few weeks I think.

The stuff I have seen on the subject recommends that someone with a
lot of experience be elected to do this - although this being an atari
group, it will probably be much easier than say, trying to set up a PC
newsgroup.

> 38400 is auto-remapped to) or do I actually set it to 38400?

Set it up in your startup.nos file.

> 2) Do I need to get rid of the modem.cpx and other serial port "fixes"?
> (if I keep the modem.cpx, what do I set it to?)

There is absolutely no need for any fix other than HSModem as it
encompasses and outperforms them all. I'm not to sure about modem.cpx
as I've never used it.

> 3) If I want to remap 38400 to 300 so that some older programs can use
> the higher speeds, how do I do it? I read the docs and they say to
> set the new speed first/old speed but its not real clear in mfp.prg
> exactly how you do that...?

Use the config.ttp or whatever it is called and passit the name of the
hsmodem program, go through the questions and it will ask you for
these speeds, check the docs for more info'.

dpj@delphi.com wrote:

>I won't bother quoting some of the comments that you made; it would be
>fruitless...

'Twould also give me further coverage. I have a slight familiarity
with how the game is played.

>IMO, you have about as much spite bottled up against Ralph/STReport as
>you claim Ralph has regarding Atari.

I've never denied it. I have received personal flames from Ralph back
in the old Fnet days, and read numerous reports of "customers" who
received nothing for their payments other than lies and aggravation.
I have also read the vitriol that Ralph considers "reporting" and,
since he owns STR, I will continue to avoid it.

>If you bothered to actually _read_ >an issue of STReport, you'd know that he is not
responsible for reporting
>any of the Atari material contained within. But, you don't mention
>that in your message.

An oversight. Just as you overlooked mentioning that, as publisher,
he _is_ responsible for guiding the editor(s) and thus has ultimate
control over the content, even if he never writes a word.

>And don't bother pointing out that it's Ralph's responsibility for the
>entire content, so it's his problem. It won't wash.

US Federal judges disagree with you. I bow to their learned decisions
when discussing the responsibilities of publishers (especially when
they happen to agree with my bias).

>Again, if you read the article that you quoted so very well, you would
>have noticed that it was an article written by Scott LeGrand, and posted
>here a couple of years ago, and then re-posted a week or so ago. It
>was cross-posted on CompuServe, where I found it. I put it into STReport,
>in a column aptly named: >>"Online Users Growl & Purr!". It's a
>"feedback" type of column. The CIS poster mentioned that the article
>was humorous - his quote, not mine or Ralph's. Wherever you find a reason
>to claim a "deep-seated hatred for all things Atari" is your perception;
>and a wrong one - whether it be directed at me or Ralph (I'm assuming
>Ralph). Slander? Yeah, right. How about satire - Scott did it well;
>and remember it's 2 years old, or older.

I read it in its entirety. I found it far from humorous. Humor,
however, is in the eye of the beholder. I'm sure there were many who

found the concept of the Holocaust amusing. Chances are, those who were amused weren't Jews.

I would also point out that the entire purpose of the "humorous" piece was to detract from the ONLY American-made videogame console. An IMB plant in the USA was kept going to manufacture the initial run of Jaguars - as you should know. How many Americans are employed making Playstations?

>Impartial reporting? Again, I re-posted some Atari satire. Deal with it.

I did. You don't seem to be dealing well with my catharsis. Ah, well.

>You have an axe to grind with STReport, Ralph, or myself - go for it.
>But, if you're going to do so, at least get your facts straight instead
>placing errant blame.
>
> Dana @ STReport International Online Magazine

With Ralph, I make no bones. He's a blight on the face of the animal kingdom. With you personally, I have not seen any particular reason to quarrel. With STR, well - it's a wholly-owned organ of Ralph MAriano, and I know it, you know it, and anyone who follows this thread had better know it, lest they be led astray by the misrepresentations therein. I realize you have to make a living; I can only assume that STR pays your bills. We all have to prostitute ourselves in one form or another, unless we're lucky enough to be born to wealth. My particular shame involves which chip maker pays me. I don't feel the need to apologize for them, however.

I'd be happy to drop this right here. It's up to you.

^^^^^^?
Why do get the same feeling when I _try_ to do something useful under MiNT?

> BTW, how much will this new Amiga060 be?
It's not new, it's with us for quite some time now. $1050. The Walker is a
low-end box and doesn't have a '060 but a 40MHz 'EC030.

And I'm talking about a plain A1200 with a Phase5 1260 in it.
Admitted, it's very plain, but so was my Falcon when I bought it.

I still think that my A1200 with a 15MHz 68EC020 gets any job done faster than
my Falcon, except for DSP stuff (and that ain't much). Just because the OS
isn't as lame as MiNT, but /really/ multitasks and with almost 0% overhead.

MiNT is "a poor excuse for" an OS. ;-)

> Well, personally I hate Amiga o/s, but that's me.. :)
Well I like it--what can I say. One big point is that it was multi-tasking
from the beginning, so all appliproggies know about tash-twitching Exec.

Does TOS have equivalents for: (or a superior system to:)

Dynamic libraries and devices;
intuition screens (with the copper custom chip);
the MUI interface system;
exec.library's scheduler;
ARexx;
FileSystems;

For one thing, I know clipped graphics output on an Atari is dead-slow, while
it's quite fast with Amiga's layer.library. If a window is (re-)rendered on my
Atari, I can almost see the individual pixels appear on my screen. The Amiga
does it between two screen-scans (well, almost).

> Especially when I use MagiC4 which is *the best*! So ner! ;)
Where can I get Magic4? How much does it cost? What are the specs? Do apps
like Signum!3 and GfA 3.6 run under it?

Well, it is true that CAB/STiK doesn't do PPP yet, BUT if you are willing to try setting it up, there is a CAB.OVL for MintNet. I haven't tried it, but I've heard that it is more stable than STiK and will do PPP just fine. So if you really need PPP access, this is the way to do it for the time being.

I'm sorry to say it, but I have the same mouse and in my opinion it's
totally crap! The mouse pointer starts running off by itself...
Maybe I got a faulty one, but considering that it says 'made in China'
underneath I guess not much can be expected.
I'll just have to continue my search for that Logitech mouse...

Hi All,

I was hoping to sign up with Zetnet ISP in the near future, but I've heard some disturbing info that when they allocate your IP address, it's sent encrypted to you.

There's no way STiK will handle that!!!

Anyone confirm/deny this?
Anyone have any ideas?

Thanks,

Yours etc.

David.

gopher: is not supported. mailto: and ftp: could be through the use of
messages. This is inpractical though as it would be a multitasking
only solution. More likely, is putting the relevent code sections into
cab.ovl once they have been proved reliable.

435. Use SoftPC to run DOS programs on ST/Falcon!

Newsgroup: comp.sys.atari.st
Date: 1996-04-07 00:00:00 UTC
From: afn14016@freenet.ufl.edu
Message-ID: <4k92oh$grp@huron.eel.ufl.edu>
Source record: 147420

I hope this one makes more sense as I really was typing fasT!

Hi Friends: I have great news for you all. As I am writing this letter
I have Geneva and Neodesk loaded in my Falcon 030 16 megs running on
my computer.

Soft PC is one of the most solid programs I have ever run on my
computer. I have been able to run OBERON Music Typesetting System
and print using my HP. Soft PC runs in color. I limited Soft PC
under Geneva to 2 megs. I have run it for 3 days and there is no
way that I can get it to crash! You can not run windows but you
can run from your HD a lot of DOS programs.

I also have loaded into Geneva STalker, which is now dialing the
internet as I try to upload this document to comp.sys.atari.st.

Also, I have loaded Steno which is what I am using to write this.
The most incredible of all is that I have Loaded SOFTPC program
and loaded in it is the IBM program calendar Creator plus which is
ready to print a nice Calendar!

So all together I have loaded and going:

SoftPC
Dos 3.03
Calendar Creator Plus (IBM PC)
Geneva4
Neodesk4
Kobold
Steno
and Stalker Dialing and ready to connect!

Well, every day I feel more and more happy and fortunate to have
an Atari Falcon. With this kind of impressive performance the
Falcon proves that it is really an amazing computer :-)

Lets talk about softPC now:

I got the softPC file and unziped it to partition C:

Oh. wait I am connecting now.....I am connected and will use
"talk" feature to talk to Katherine Ellis for a while before I
post this!

Ok, I am back after a 15 minutes talk! and I am still running
every thing :)

so, I got the folder SOFTPC on C:
and copied the file C_DISK.HDF to partition C

I booted the computer with Jar10.PRG in the Auto folder and
NVDI. in 16 colors mode 640x480.
then, I run the PCRUN.PRG and it took about a minute for the
program to load.

At that point I had a dos 3.03 disk in drive A and DOS loaded.
I most tell you that I noticed that the GEM menu was still
available as well as the ACC's so that is why I decided to
experiment and run it from Geneva.

I set the PCRUN.prg As single tasking to avoid troubles.

Ok, so DOS loads fast and the screen is in colors. I run some
programs I run on PC Ditto and they are way fast!

Also, I feel that running the Calendar Plus is a good test as It
takes about 30 minutes to decompress as it is installed.

I got an IBM friend who gave me the program and he says it does
take time in his computer as well.

Any way, I having running this thing for two hours now and not a
single crash!

The SOFTPC installation was as simple as I said. You can
configure the drives on a GEM . Simply go to the far right menu
and select drive D and select create a drive. I created a drive
on partition I and gave the path name I:\DATA and the space for
it 5 megabytes. That was all, I then run the installation for the
PC program etc.

I also was able to run IBM programs from disk. I had had this
gizmo for 2 1/2 hours and it is impressive.

If you have a Falcon GET IT! IT is on the POWER CD from Compo and
Toad has it for $34.00

I do not know about you , but I am impressed with this Falcon 030
and SoftPC combination and I wonder how it will be with an 040!

I hope you found this useful. Raymond

436. SoftPC Installation and Users Guide.

Newsgroup: comp.sys.atari.st
Date: 1996-04-07 00:00:00 UTC
From: afn14016@freenet.ufl.edu
Message-ID: <4k92u5$gv8@huron.eel.ufl.edu>
Source record: 147421

This is one of the most solid programs I have ever run on my computer.
I limited SoftPC under Geneva to 2 megs. It is really a nice program
to run dos programs on your Atari.

DETAILED INTRUCTIONS ON HOW TO SET UP and USE SOFTPC FOR ATARI
Available on Power CD From Compo Software (TOAD COMPUTERS)

by Raymond Lohengrin

UNZIP FILE softPC and copy SoftPC folder to your C: Partition. Inside
the softPC folder you will find a zip file called C_DRIVE.ZIP. Unzip
this file and copy the file C_DRIVE.HDF to partition D: or just keep
it in the SoftPC folder. (this folder is a virtual IBM PC C: dive)

SoftPC looks at the file C_DIVE.HDF as a PC C: DRIVE. All files that
you copy from DOS to C: will be stored in the HDF file.

Loading SoftPC.

To load SoftPC run PCRUN.PRG. After about 5 to 15 seconds you will see a
Balck screen with GEM menues on top. This GEM menus are to configure
SoftPC and they are available at all times. If you have any problems
returning to DOS just select from the FILE menu RESET PC and then
abort. This trick can be used at any time to "WAKE UP" SoftPC.

The Gem menu PC drives is used to tell SoftPC where to find is
program folders and wich files will be used as "PC Drives" Remember
that your PC drive C: is not really your Atari C: Drive. When you use
DOS commands to format, write and copy to any DOS Drive (not A: or
B:) you are really refering to your .HDF files.

Select from the PC Drives menu E: HARD DISK to tell SoftPC where your
folder SOFTPC is. (C:\SOFTPC*.*) The path should be set up already.

To configure your PC drives go to the PC DRIVES menu and select C:
HARD DISK. Select your original C_DRIVE file nad click OK
To created additional drives, select D: HARD DISK. Then, select
"CREARTE". You will need to write the information about the path of
the new HDF file you are creating and its size. Make sue not to
create an HDF file larger than the space available.

Example:
Create a new HDF file called MY-DATA.HDF with a size of 5 megabytes
long. on partition E: of your Atari Hard Drive.

Select D: HARD DISK from PC Drives menu and then select CREATE.
Type the following.
Disk Name E:\MY-DATA.HDF

Disk Size 05 Megabytes

Click OK.

The new file will be created on partition E: and then you will select
again D: HARD DISK but this time select FILE and locate the file
MY-DATA.HDF. The program will asked to be reset to activate the DRIVE
you have just created.

Now, load DOS from your floppy and at the DOS pront A:\ type "dir"
to list the available files.

Type C:\ and then "dir" to list files on C:\

To copy all file from a:\ to c:\ type a:\ retun and then copy *.* C:\ return.

To format your new created "D:" drive which is really your folder
MY-DATA.HDF"

type fdisk to run the fdisk program.
After it loads select 5) to change current fixed disk drive.

Enter 2 at the:
"Enter fixed Disk drive Number (1-2).............2"
Use option 1 to create a DOS partition or Logical DOS Partition.
Select "y" for yes to use all the available space.
Press ESC to exit the fdisk program.

At the DOS pront type
format D:
the system will warn you that

"ALL DATA WILL BE ERASED"

Don't Panic this is just refering to your folder My-Data.hdf :-)

After your file is formated (drive D:) guive your new drive a label
like "PROGRAMS"

That is it, you have now a new drive D: available to SoftPC.

At the DOS pront type A:\ and return
Then type copy *.* D:\ to copy all information from a:\ to d:\

You can create as many D: partitions or HDF folders as you like, but
you will have to reset SoftPC for the DHF file to be available.

Enjoy softPC.

Raymond Lohengrin 4/4/96

Some useful DOS Commands:

"dir" List information on Drive
"copy (file name) C:\ Copy the file to C:\
"del" Delete

. Every thing
*.DOC all file ending with DOC
CD (directory or folder name) Chage to a directory Example CD DATA

Other Information.

To return to DOS use Control/Alternate/Delete.
If you are booting from C:\ make sure not to have a floppy on A:\
If you want to boot from A:\ use a floppy containing DOS.

Use PCDFMT to format floppys.

Argh! It only runs in 640*480*16, and not even on graphics boards :-(.
I'd like a GEM version of that.

>As far as I know its not PD or shareware !

OK, I have deleted it. Would the developers please state the current
status of this program? Who are they?

>Also you need DOS aswell (preferaby v3.3)

Does Novell-DOS run?

I think I have also come across the Jpeg problem. Usually a press of the esc key will do the job. But one word of warning don't press the esc key more than once because I've got the program to bomb/quit (have to re-check which) if you press the esc key a few times to much. This though is something avoidable and to date I have had a few hours downloading without any problems.

When the Jpeg option and Forms are working it will be even better than it is now. And now it's very good :-)

442. Falcon/SVGA problem

Newsgroup: comp.sys.atari.st
Date: 1996-04-07 00:00:00 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <5fCLWS1.lmcclure@delphi.com>
Source record: 147427

Today, I took the plunge a purchased a color monitor for my Falcon030;
a Hewlett-Packard 14" multiscan.
-
I met with disappointment after the system booted up and reached the
desktop, as their was some slight unstable "tearing" of the graphics
across the upper part of the screen where the icons were. (To describe it
further, it is a horizontal distortion of some of the scan lines,
"smearing" them across the screen to one side, typically to the right.
Also, the effect is not static, but rather "dances" or jitters back and
forth). Dropping down the menus, especially those closer to the center of
the screen, or large dialog boxes, such as the system file selector
increased the effect.
-
Naturally, I expected I had a defective monitor, as when I plugged the
old monochrome VGA I had been using back up, the Falcon's display was as
stable as a rock.
-
When they tried out the HP on a Compaq at the store, however, it exhibited
nary a problem. I have also since tried it out on my Amiga in
Productivity (640x480 VGA scan rate), Euro 72 Productivity (640x400 at
72Hz), and DoubleNTSC (which is scans at 29+ Khz, slightly below what the
monitor is spec'd for), resulting in an absolutely stable display each
time.
-
Bringing it back home, I tried various color combinations (i.e., deleting
all reds from the palette, all blues, etc.) in an effort to make certain
it was not the output of a specific signal causing the problem (which
seemed reasonable, as the mono VGA monitor only responds to the green
output). None of the combinations cured the problem. Lowering the
resolution made the problem less pronounced, though testing the 640x480
desktop with fewer colors (I was using 16) seemed to indicate this had
more effect than the actual resolution.
-
Has anyone else with a Falcon run into similar problems while using a
SVGA color display? At this point, it seems to be the culprit.
-
At this point, I have a display I really cannot use (at least until I
get a SVGA card for my old 386sx-25...the Amiga really needs a multiscan
that can range down to 15.75Khz to be useful), and no reason to believe
another color SVGA monitor would work any better on my Falcon.

Hi All

I've just bought a 1 meg STFM for my two sisters to amuse themselves with. Now they want a printer, and the old man has agreed to buy one for them.

The girls need a colour inkjet that will work happily with programs like Write On, Hyperpaint and Imagecopy. As they only have 1 meg to play with, they need a printer that can work happily within this restriction. As I haven't got a clue as to what colour inkjet printers work well with STs I'd be grateful if someone could suggest a suitable make and model.

The budget will be around 250 GBP to 300 GBP.

Any suggestions gratefully received either in this group or to:

mike@coconut.demon.co.uk

Thanks in advance to anyone that can help.

>
>Thanks for any help that can be offered.
>
>Steph.

Hi Steph

I finally managed to get my CD Rom working with both the ST and the Falcon,
I am using ExtenDOS though. There were problems, but I sorted them
eventually. I also use a Link II, which seems to be the best thing to use.

I am also after a load of CDs with piccies, fonts on. System Solutions sell
about 25 different ones (they have a free floppy with a database on), but
they seem rather expensive to me. 16/32 also sell some CDs, but although I
have a listing and prices, I don't know what is on them.

I was going to buy a few font CDs (Truetypes), but was just a little
concerned that the fonts may be in an archived format, and not directly
useable on a ST/Falcon.

I am absolutely certain that there is somewhere a big regularly updated
list of CD roms that can be used with the ST/Falcon. I saw reference to it
recently, but totally forgot to note where it could be obtained from :-(

Perhaps someone reading this could enlighten us?

ATFalconBeST!

: differs but from time to time CAB stops loading (esp. on jpg's as I
: noticed). And I've got HSMODEM installed.

: I did not have this problem with the www116-package.

: Andreas

I have had the same problems - glad I'm not the only one. It seems to happen at the last few bytes of the picture as it is downloading it, and only on specific sites.. The only thing I have different now than before is a few of the TCP/IP settings were set by Install.. I had decided to use that instead of coping the files just to check it out. I tried changing them back and it stopped working - but I have a feeling that this was due to some random thing at my ISP because from time to time it acts up.. I am going to try setting them back to how I had them before and see what happens...

I hope this is a joke? I see nothing about CAB supporting Java, and would doubt it to do so in the future, no matter how much we want it.

BTW: I missed earlier posts of this thread, but I assume that the "jpg problem" is where a page with imbeded JPEG images sorta just don't do anything - doesn't lock up, modem receives data, but CAB sorta seems to lose interest in it.

It's caused me some confusion as well in the past. I installed the IDT
cookie in the end to make life easier, because I was erasing the wrong
files :-(

Is it only the Americans that do their dates like this? Nothing wrong with
it, just it might be better to adopt a 'world' standard when a group like
this is so international!

Anyone for a vote?

>email: kellis@mhc.mtholyoke.edu

Hi Katherine!

I have a feeling that Thing 1.0 (English version) is only available to registered users of Thing 0.59. The guy in the UK supporting it is Joe Connor and in his list it says this quite clearly.

In fact here is the extract from the list:

v1.0b Thing 13# [S] Desktop replacement, full AV server
v0.95 Look'n See 20 [S] File manager/viewer, 99 amazing modules!
v1.3c A'la Card 25 [S] Adds GFA Basic colour and MagiC Mac support!
v1.01e ToDo 13 [S] Project manager, simple notepad style
v2.06 GDOS Check 6+ [F] Create GDOS font lists, test printable area
v3.0 JML-Snapshot 12 [S] Screen grabber, IMG/IFF/TIF, can grab windows
v01/96 1st-Guide 20 [S] File viewer/hypertext [ACC/PRG][G]
Christoph Zwerschke 10* [F] LED Panel, DiskCake, FontSel, Ikarus etc
Internet Access Pack 15* [F] CAB plus STiK, on-line OVL file & scripts
---
Key: [C]=Commercial [S]=Shareware [F]=Freeware [R]=Fairware
[G]=German [GD]=German Docs +=Minimum *=All titles
[ACC]=Accessory [PRG]=Application [030]=Separate 030 version
All prices in pounds Sterling! #=Registered users only
==========

From the key it appears that Thing v1.0b is shareware and costs 13 GBP and is available to registered users only.

It might be an idea to contact Joe Connor direct to clarify the situation.

Hi!

I've got an original, unregistered copy of Mark Williams C compiler kit.
The original disks and both manuals are in very good condition.

I'd like to change this packet to *ORIGINAL* copy of Cubase 2.1 (or
higher) with original disks, manual and the dongel.

I live in Finland, and I'll take care of the postal costs.

Mail me for further details! =)

Help!!

I'm attempting to get another deamon running on my MiNT/MiNTNet system. This time it's ftpd (finger is running ok).

syslogd, inetd and portmap are all running ok and the required changes have been made to inetd.conf.

When I attempt to start a ftp session with local host I get an error message 441 saying service is not available.

While I'm here, can anyone tell me how to get MintOS installed properly, I get errors saying I'm not allowed to login from this terminal....

.. Eat prune yogurt for that "get up and go" feeling.

456. NEW! NEW! NEW! THING V1 ENGLISH VERSION!!!

Newsgroup: comp.sys.atari.st
Date: 1996-04-07 00:00:00 UTC
From: Katherine L Ellis <kellis@mtholyoke.edu>
Message-ID: <Pine.ULT.3.91.960407232103.27274B-100000@mhc.mtholyoke.edu>
Source record: 147441

Hi everyone, I posted few days ago a message about a brand new
Thing v1 ENGLISH.
A lot of people are really interrested by this excellent shareware.
So I did translate the program. (This program replaces the desktop,
fully compatible with MagicC or Kobold2 . Some features in Thing v1
had been made for.. GREAT!!...)
It's done.
I'm just testing for the bugs.
I think it will be available on my page today or tomorrow.
-----> http://home.mtholyoke.edu/~kellis
I will zip the complete package, which will contain the original
german version+the english version+some files needed by THING v1.
I'll try to do this package, 'ready to play'.
So the only thing I'd ask to the downloaders is to send me a message
via email ,saying something like "I got it" or whatever..
This is the only thing I would like to see. BTW I don't work for
anybody. I did that because I think that there a lot of good software
in the world but the problem is the language. And I think that it is
important for atari users to help each others, I mean more than we're
doing, which is not so bad by the way.
That's all. Thank you for your time.. Bye...

brimiller@delphi.com barked in U.COMP.SYS.ATARI.ST on 07 Apr 96:

b> A) A pro-Atari or even non-anti-Atari Ralph Mariano is an amusing and
b> remarkably strange thought. So Ralph's a jerk. Most people have known
b> that since 1987.

Still, there are those who remain blissfully ignorant.

b> Most Atari employees have been screwed. Atari creditors and
shareholders
b> have been screwed.

There aren't any "Atari creditors." While no one could honestly claim that the Tramiels have done much to market their products, the one thing they _have_ done is keep Atari on a "cash and carry" basis since JT bought the company from Time-Warner. That's why Atari remained in business, however small the business was, when Amiga rolled over and played dead.

b> I once heard someone say ABCO stood for A Big Crook's Operation.
b> Demanding impratiality from ST Report is a futile effort. I've tried
b> many times. -

Oh, I don't demand impartiality. I demand Ralph's head in a silver charger. Of course, if one were to give his head an enema, it might fit in a teacup.

b> C) Ever wonder why Atari always survives catastrophes with large sums
b> of cash? It's probably because none of that cash was invested in any
b> marketing operations.

It's because they don't owe anybody any money.

b> The sooner Atari Corp. is shedded and forgotten, the better for the
b> long-suffering users!

I can't argue that. There are other TOS computers now in production, and by all reports, _all_ of them are superior to Atari-made systems. Of course, this is also true of IBM clones.

b> BR Miller

You wouldn't perchance have any connection with Turbo BBS?

Look out for computer fairs and actions (All Formats are quite good) I
got quite a few of these generic CDs from there and they cost about
8-15 quid with most of them being just over a tenner.

>I was going to buy a few font CDs (Truetypes), but was just a little
>concerned that the fonts may be in an archived format, and not directly
>useable on a ST/Falcon.

Almost certainly not(archived)! If you've got 650meg of space to fill
then thats one hell of a lot of fonts needed to fill it and any CD
that I've ever seen has clearly stated that they are archives as it is
obviously a fairly strong selling point if the buyer is going to get
an extra 600+ meg of data.

>I am absolutely certain that there is somewhere a big regularly updated
>list of CD roms that can be used with the ST/Falcon. I saw reference to it

>The budget will be around 250 GBP to 300 GBP.

Just go for something like any HP model (eg 660c) or an Epson Stylus.
Their output is great but although anything will print out with these
models most packages will not take full advantage of them so don't
worry about all the fancy specs too much. Any modern printer should
work fine but HP models are very relyable. I have a HP 540 printer
which has a switchable cart for colout or Black, it's OK but colour is
somewhat of a novelty and one with both carts available at the same
time (like the 660c) would be far better. Get a PC mag' and see what
is out there.

g>
g> Obviously, the date is February 14th, but, as someone domiciled in a
g> country that formats dates as DD-MM-YY, the first thing one thinks of
g> is "2nd daty of 14th month of 96". That is obviously incorrect.
g>
g> Confusion is likely to arise, especially with dates like "4/5/96". Is
g> that 4th of May, or April 5th?

Gaven, as far as I know, the US is the ONLY place where people think the natural order for dates is medium-small-large (month-day-year). I've spent 15 years out of my native country, and while I'm happy to be home, I am among the first to insist that some of the things done in the USA are spectacularly short-sighted, not to say stupid.

Simple solution: Note the poster's country code. If they don't have one, assume they are Americans and ajust your mental picture accordingly.

Hi.

I have just bought a fax modem for the first time, and am starting the search for the most appropriate software (Shareware or Commercial).

I would love to know what is out there, and what is the best product available. I would love to know what you use and how it works for you.

Please e-mail if you have a chance. Taaaa.

>I personally would prefer my AmigaOS 3.0 over my Atari's MiNT anytime. My apps
>(like POV) run faster on my 68EC020-15MHz than on the Falcon with it's 030.

ermmmm which version of POV you running ????, 16Mhz 030 is faster than
15Mhz 020, and seen as the OS has nearly sod all to do with how fast
POV runs, it kinda suggests to me that either you have POV badly setup
on your Falcon, or you are running a rather crappy 68000 version !

make the most of the setup and get an 030 version, and even better
spend 30quid on an FPU and run FTPOV, and then compare !!!

The next question is.... has anyone already started the ball rolling
???? is there a moderator already setting things up ????

I would volunteer myself, but I know sod all about doing it, and
wouldn't even know who to notify, so if there is no moderator, and all
we are doing is sitting round chatting about the idea, is there anyone
reading this who has the internet know-how to set this up, who would
be willing to get it going ???

>about it.

Compared to other Atari OS's or other OS's in general ???

compared to other OSs in general, the size and due to this the speed
are a great advantage. TOS in my computer is less than 256K, compared
to Windows (3.1 or '95) thats tiny, thing is though its also held in
chips inside the computer, so I don't have to wait for it to load
(well not longer than a second or so), and being so small there is
tonnes of memory left over for other programs, so there isn't any of
this virtual memory junk and harddisk swapping all the time. The
other advantage for beginners of having it on chip, is that you can't
damage it in the same way you can kill windows, just by deleting a few
files. If TOS buggers up, you just turn the machine off for a few
minutes and all is as new.

The disadvantage many say is upgrading, but considering an upgrade
costs about 50quid, thats pretty resonable in my books, and in most
cases the upgrade isn't too difficult to fix.

Compared to Atari OSs the greatest thing about TOS is compatibility
with software. 99.96f atari software is written to run on TOS, and
as such it is unlikely to crash. Although people are now aware of
other OSs like Magic et al. not everything takes account of this, and
most older software isn't magic aware.... the consequence is that some
software refuses to run, either messing things up, or simply crashing.

>I think it's the 'Courier' or some other 'heavy duty' USR modem.

This may be the compresssion working..... you will notice the higher
speeds most on files which are uncompressed, or badly compressed eg.
ASCII, but least on already compressed files such as ZIP or LZH
archives. I think the Courier has the compression, and probably the
Sportster too.>
>

>>I wonder how you manage to supply 3000cps, with an unaltered port/OS,

>wrong, but I could check this by looking at the 'Connect' log file.
>My SOUP reply packets are usually quite small, so it's hard to get a stable
>speed, even though the average speed might still end up at around 3000 cps.
>I've noticed that data doesn't arrive at a stable, constant rate, but
>rather in 'chunks', varying the cps rate considerably! Don't ask me why..
Are you sure the SOUP files are 'ZIP' compressed..... try archiving
one with ZIP or LZH and see how much smaller they get... if they
compress tonnes more then compression helps, otherwise I don't know
how you are managing it especially with a modem which only does
14400bps = 1800cps max !!!!!

>
>Receiving files is considerably slower though- I almost always end up at
>1620 cps.
that would be about right for a compressed archive.

>1.62 which I got with my machine. I guess you won't notice such a big

>difference when upgrading from 2.05 except a few bugs being ironed out.
Thats the problem, most companies will sell me TOS2.06 roms, but for
50quid, and as the only difference is a few bugs sorted and the Atari
logo on bootup its a bit of a rip-off IMO !!!

Probably because most people who use MagiC Mac have been using their
STs for quite a while and are what some mags would call 'advanced
users' who know their stuff and don't often ask for help..... and so
most of the qbove sort of questions are asked by beginners using an
ST, not someone running MagiCMac (anybody else round here use MagiC
Mac ???).

A brand-new C64 CD-Rom is available.
5650 C64-disks are on it.

The files can be used in most available C64-emulators for almost every computer-system.
The files can also be easily transfered back to an original C64.

Play the old games again, or watch the demos.

For a complete index-file ftp to:
utopia.hacktic.nl pub/c64/Misc/c64cd96.lha
dhp.com pub/c64/scene/others/c64cd96.lha
arnold.hiof.no (still in the incomming directory)

All you'll ever need for the C64 is on this CD-Rom!

For more info or orders, just send me an e-mail.

480. HELP: Extendos Pro v2.3a

Newsgroup: comp.sys.atari.st
Date: 1996-04-08 00:00:00 UTC
From: chriswil@southern.co.nz
Message-ID: <4k9nui$ll6@orm.southern.co.nz>
Source record: 147557

Hi there...

I've just upgraded ExtenDOS Pro v2.0 to v2.1, and then v2.3a. The new version of ExtenDOS is great, but I have the following problem...

When I use CD-Audio to record a sample from an audio CD, the resulting .AVR file is a mess. When I play the .AVR back via SAM or whatever, the file sounds like the CD was skipping during the record. This is unusual in the respect that the recorder is supposed to record the audio data purely via the SCSI-2 cable (DDD!! :-)), and therefore the drive should just dump the binary from point A to B into RAM via SCSI, and then CD-Audio should convert to the selected sample rate/stereo or mono etc...

This is obviously not working correctly. Does anyone else have/know how to correct, the problem?

BTW, I run a Falcon030, 4meg, with PowerUp2 clocking the CPU @ 32MHz, and FPU. The CD drive is an NEC MultiSpin 4V SCSI-2. ExtenDOS has been able to autodetect this unit at bootup, and Cd-Audio has worked from day dot, including when I only ran v2.0.

TIA etc...

Chris W.

j{ I have had the same problems - glad I'm not the only
j{ one.

I've had this problem, not only with JPEGs but with large text-only pages. It seems that I can go to several sites and then after a while, it's like CAB gets "Full" and just hangs in mid-download -- no activity from the Modem, the little clock face doesn't move back and forth any more, menu calls do not work, and the ESC key does nothing.

My work around has been to reboot the system with the Control-Alt-Shift-Delete keypress, but this takes a while and wastes online time (and time is money...).

I'm running a 1 Meg STfm, TOS 1.04, with version 6 of HSMODEM installed. I have played around with the settings in the DEFAULT.CFG file (Thanks Guy for the Email explaining the codes) but wound up putting them back to the original settings.

Any ideas?

I'm selling the following Atari items. POSTAGE IS EXTRA.

IMPORTANT: Everything is sold "as is". Any known defects are listed.

HARDWARE:
ATARI 1027 printer $2 defective. 1st 40 columns prints normal, 2d 40
columns print scrambled text.

ATARI 810 disk drive defective $5 Spins, but doesn't read.

MPP-1150 Parallel Printer Interface $2
Connects Atari 400, 800, 600XL, 800XL to a parallel printer using the
36-pin Centronics standard. It also worked with my 130XE.

SOFTWARE:

ST SOFTWARE - All of the following software for $20.
Time Bandit, Bard's Tale 1, Arctic Fox, Boulderdash Construction Kit,
Night Hunter, Bubble Ghost, Populous, AD&D Hillsfar, AD&D Heroes of the
Lance, GFA BASIC 3.0 and approximately 30 disks of public domain software,
mostly from Bre Software and Accusoft.

ATARI 8-bit SOFTWARE - $5.00 for all
Ballblazer, Lords of Conquest, Guantlet, Micro League Baseball, and a
Galaxian cartridge with no box or manual.

MAGAZINES: 25c each

From: pnf@dana.ucc.nau.edu
Message-ID: <4kakuj$86t@ruby.ucc.nau.edu>
Source record: 147566

Hello all,

I have a PS-3000 colour monitor +built in disk drive and a SLM 804 laser printer that I would like to trade for one of the following items.

Latest version of E-magics Logic, A C-lab combiner, or Cubase 3.0

The Monitor is in perfect shape with power cord ect. It is missing the Cable for the drive to Atari connection but I'm told that this is cheap from Toad. The Printer works fine, has all drivers, but has had the toner spilled in it so it's a bit messy. I do have the toner tube though(or what ever you call what you the toner in).

The catch, I'm currently unemployed so I can't afford to pay the shipping on these.

If you have any other neat midi items to trade don't hesitate to make me an offer.

E-mail me (Arik, not Peggy) at pnf@dana.ucc.nau.edu

Be well,

-ARIK- Implosion Studios at pnf@dana.ucc.nau.edu

Hello!

I only have a telephonenumber in germany. They have a short
adverticement in the german magazine "Keyboards". They build this
midi-expanding-board for ATARI-Computers. I costs in Germany DM 50.-
(about 20 $).

The number is: 0049 2434 4149

Perhaps it helps. I don't know more about this.

Printing is pretty reliable with graphics using NVDI4, but some pages
seem to be too much for it. Can't quite work out which and why....

>I did visit the Hensa WEB page (a link from some one elses page) and it
>loaded OK but when I tried to get a file it kept reporting that it
>couldn't get it and seemed to be looking in the Cache on my drive for it
>or something ! Could it of been if Hensa was busy and it wasn't allowing
>access like it does when there's to many FTP'ing to it ?

If you check the HMTL code for the Hensa site it's actually a hotlink to
a gopher URL. Other sites try to connect you to ftp addresses to get
files. Unfortunately CAB doesn't yet support these. On Websites where
you get direct access to binary files (like UMICH) this is not a problem-
get CAB to direct the filetype straight to your unpacker.

As with the forms problem people have been having, it's a case of there
being more than one way to get things acheived, but CAB not supporting all
the possible options.

Look for a package called Junior Office - you need version 3.04e (or is it
3.4e), which is the english translation of the german original. It's
shareware but completely useable and pretty easy to set up.

A tip if you do try this one: if it won't dial properly remove the Hayes
commands from the modem set-up menu (ATZ, ATDT etc) as these are already
coded for you - whoever left them in the menu did this by mistake.

Have fun

503. Advice sought: hard drives...

Newsgroup: comp.sys.atari.st
Date: 1996-04-08 00:00:00 UTC
From: mathis@clark.edu
Message-ID: <4ka781$imq@cis.clark.edu>
Source record: 147580

Howdy...

As there was no hard drive in my Easter basket, it seems that I'm going to have to buy one for myself. [My old Seagates came from a BBS and ran for approximately six years nonstop _before_ I got them last year, so they're living on borrowed time--at least one is, for the others have given up the ghost already... ;] Unfortunately, I've been quite dumbly skimming over the perpetual discussions here about factors to consider when buying one of the more, ahem, "modern" drives.

I was fairly informed on memory issues when I was ready to upgrade and subsequently bought four megs from a private seller, but current storage prices are low and drives have too many variables to make buying a used unit from a private party desirable. With that in mind, could someone kindly answer:

o Is parity an issue when using an ICD AdSCSI+ as the host?

o About "termination power": What is it, which end [drive or computer] supplies it, and do I WANT it or NOT WANT it? Is it configurable in some way as parity sometimes is/was? [That is, is there a workaround--not involving soldering irons--if I find myself with the "wrong" drive?]

o "Bus arbitration": Same questions as for termpwr.

o How can I phrase inquiries based on the above items to drooling klone-damaged salesnerds without appearing an idiot in need of salvation?

o Finally, can anyone recommend specific drives and, if possible, mail order outfits to favor/avoid? I'm aware that the Quantum Fireballs are problematic, but what of, say, the newer Seagates or other brands/models? To summarize, I want to buy a new drive, more than 200M but no more than 540M, from a reputable dealer, and I want to know before ordering that it will work as it should on my STe. As you may have guessed, web sites for manufacturers haven't been terribly illuminating in this respect.

Thanks much in advance...

First of all I need to thank all of the people who have answered my
previous posts. THANKS!!!
I recently acquired a 520stfm without a monitor and had no idea what
to do with it. I posted a couple of messages here and got great
answers. I have a monitor now, but I'm having problems with loading
programs. The only software I have is what i downloaded on my pc at
work I got *tos unarcing programs they seem to work but everytime
I type in the program they are supposed unarc/unzip/unlha the screen
goes blank (white) then it returns to the desktop. I've talked to
toads and they say it could be the programs. Are 720 dd's from my
pc compatable, Also the drive will only format single sided 360k
Anyone out there have a clue? Thanks in advance.

Hi John,
For my fax needs I use Coma and as terminal program i use Connect (my 30 hours free test period for Connect is about to run out, so I'll register soon).
Both are Shareware and very well written programs.

Best regards,

Claes

Are you absolutely sure that the NEC-drive is able to make SCSI-transfer of audio files? I've tested several different CD-ROM drives and the only ones that always work are Toshiba. If your NEC-drive doesn't support this function, maybe ExtenDOS tries to emulate it somehow when the drive can't handle it?

Best regards,

Claes

Actually they're made for SIMMs and not SIPPs.

> Are there any other ways ?
> Could it be possible to convert them into SIMMs with a simple
> adaptor ?

To explain it simple: the SIPPs are nothing else than SIMMs with added pins
that are soldered on the connector side.
Just remove these pins with your soldering pen and voila' - you've got yourself
some SIMMs instead.
There are plenty of RAM-boards around that use 30-pin SIMMs to expand your
Falcon's memory.

> find it/them?

You should be able to use it since it's SCSI. PD program to use is MetaDOS, but
I have no idea how to set it up, since I've always used CD-tools, which is
commercial.
The only thing you have to think about when connecting all you SCSI-units is
the ID-number and the termination.

> 4. Assuming I get my CD-ROM working, is there any way I can
> spurt digital data direct from the drive to memory without using
> sampling software? What I want is some high quality samples from
> CD. The data is there as digital data already. So why sample?

I believe that the only CD-ROMs that support transfer of audio directly via
SCSI are Toshiba. I've been told that some Sony CD-ROMs can do it as well, but
I don't know which models.
CD-tools has always been able to make use of this function and that's why I
chose it instead of ExtenDOS, but the latest version of ExtenDOS can make the
SCSI audio-transfers also, so for the moment I guess it's the best choise. I
don't know if there are any PD programs that can do these transfers.

Source record: 147590

Whoah, whoah, whoah. I'm really sorry , Thing V1 english is the THing V1
German translated, that's all. This software is a shareware, not cracked.
If you register for this software you will get from the author, some
software, the newer versions, some supports via email or telephone, and
also get the screen cleaned , because in this version, there's a big
" S H A R E W A R E " in the middle of the screen. Also for the register
users they'll get all the options available.
In no way did the author mention that the register users would receive the
english version; nor was it mentioned that only register users could
receive a translation. In fact, it would be stupid , because the software
is not usable or tryable in the german version. That's why I just
translated it . That's all. I never mess with cracked software.
I agree with you regarding the pirating of software, especially with Atari.
If you do not agree, please email me.

Even now my drive is set as ID 0 - still no dice.

When I've formatted in the past I've used ICD software and then repartitioned
with either ICD again or now HDDriver - that's the only way it'll work.

To: bdc2@po.CWRU.Edu (Boris D. Cahan)
Subject: NEEDED:(US):Used TT/Mega keyboard

Boris asked:

b > Lust bought a used TT030 with a broken keyboard. I cant see
b > buying a new one from toad for almost half of what I paid for
b > the computer. If anyone has a spare one they want to sell,
b > please let me know. Boris D. Cahan bdc2@po.cwru.edu

I had the same problem a few years ago, but I solved it & it remains solved by buying a DEKA. Now I can plug ANY pc clone keyboard into the DEKA (which is simply plugged into mt TOS machine) & type away. Indeed, I keep buying used pc KB's - the latest one cost me $8 in a 2nd hand store & it works flawlessly :-) Lately I spotted a 101 key ergononic KB in Computer Shopper for $35, so I'm sending away for it - knowing it too will work flawlessly in my TOS universe :-)

Personally I don't think you'll be making the `write' move by spending almost any bucks on a new TOS specific KB - since it's also likely to break down eventually & you'll be back in the same leaky boat :-(Besides, the DEKA has no moving parts & shouldn't EVER show any signs of wear - obviously, so with the many advantages that route presents, it's the smart route to go :-)

As an aside, Atari made another whopping marketing mistake when they made the TT/Mega STE's by not making them accept standard pc clone KB's, but that's just just another whopping marketing mistake they made which led inevitably to the demise of their computer division

>or even German version ever released for TOS?
>If so, where do you get it?

Hi Mike.

The NeoN program is in English anyway but all of the Docs., manual etc. are still in German. Distribution of the package is by Compo and I tried in vain last summer to buy a copy from Compo UK. Due to a lack of interest at Compo, I eventually gave up and Compo UK have now gone into liquidation.

I would still be interested, though, and I have a demo copy which runs well on my Falcon. I believe I downloaded this from Hensa but if you want me to check further then e-mail me.

Another really good one I have found comes from France and is called Cloe. Again, I have a demo version but I don't know if this one went beyond that. It has a VERY intuitive interface (especially for a regular 3D Studio user like myself) and has the added advantage that it loads both 3DS and Imagine files.

Cheers

Ed.

No probs here either. My SVGA (very cheap, unbranded) gives rock
solid display. I normally use it with Screenblaster in 800*600
resolution.

Maybe some particular characteristic of the HP monitor is incompatible
with Falcon?

BD>The Falcon was released way before EIDE, so I really doubt it'll work.

That's absolutely wrong. I've got a Mitsumi FX300 IDE (slave) and a Seagate ST3391A (master) working together in my falcon. Unfortunately there aren't any freeware cd-rom drivers for IDE-cd-roms, so I had to buy the CD-Tools from Hard&Soft in Germany.

Spot on.... Atari Started out making home computers, they grew on
that. So atari is gone now ? big deal, is that any reason to stop
making computers that can be bought cheap, and sell by the millions
???

If all the new TOS compatible computers are going to be multi-thousand
pound Medusa clones, then only the very elite of atari users are going
to buy them.... and this will be the death of all TOS compatibles.
Make cheap machines, make affordable machines, make a machine that
many housholds and people can afford easily..... this will make a
success, or at least do better than selling only a few computers a
year.

>I think this is a little unfair.

Ok I was being a little tight, but I still think the 2nd hand drive is
a little over priced.

>
>Okay 270+VAT = 317ukp. However a case and SCSI2 cable is going to add at
>least 50ukp+15ukp+VAT (76ukp) to this. So aparently you can buy a 2Gb drive
>config for 393ukp. This is nearly 4 times the asking price and if you
>haven't got 393ukp then 100ukp for a 270Mb drive isn't all that bad.

no 100 quid isn't that bad, but then again its not that cheap for a
2nd hand drive.

>
>Also quite how do you get 270+VAT for a 2Gb SCSI drive? An EIDE one might
>be in that price range - but SCSI ones are 400-500ukp +VAT.
that depends on what sort you are looking at, most SCSI drives at that
price are for audio and video recordings. BTW a new 2Gig SCSI drive
as the paper says is 270+VAT, and this apparently is going to cause
other drive prices to drop.

>This makes the
>price of a 2Gb config 546ukp ie nearly 5.5 times more expensive than what
>this guy is asking for a slightly 2nd hand 270Mb config!
>
>Offering 50quid would just be taking the mick.

ATM thinking of getting a new drive, for my MegaSTE... I can fit a
bare SCSI drive, and for about 155quid+VAT I can get a NEW 1Gig drive,
with 10ms access time and 512K cache RAM onboard. At the price of
100quid, a 2nd hand (however slightly that might be) is quite
expensive...

Hi! By far the best semi-retail buy I have found is HI-TECH.
They are a used disk and other supplier. For example,
I biught a reconditioned Seagate st 3600N 3.5" 1/3 ht.
525MB HD, 11 msec avea□. access time, for 149$!!
Not bad??They have others, too some new, some reconditioned,
and a lot of them SCSI-1, that work fine with ICD+ controllers.
They have an internet address withthe latest availability
and price list:
http://www.internet-cafe.com/hi-tech/
Thats what I bought, and it plugged right into my ICD box.
Works great!

The 520 STfm 'Should have' a Double Sided drive, BUT,
it may be like the one I just looked at. Some one had swapped the 720K
drive with a 360K drive out of a SF354 external floppy drive (Single Sided).
It sounds like someone did the same with the one you have.

Seagate ST3600N, 540 Meg, SCSI 1 and 2 compatible.
Fujitsu M1603S, 540 Meg, SCSI 1 and 2 compatible.
I prefer the Seagate but so far, the Fujitsu hasn't given me any
problems. With the AdSCSI+, Parity is not an issue. On both drives they
normally come set so the each drive supplies it's own power to it's own
terminators. Of course it can be changed by jumpers.
Where to get them, I checked this place out, WWW site, and
it looked damn good;
"www.internet-cafe.com/hi-tech/"

Hope this helps; Rich Mier

If you just want to make sure it works (and assuming you're running
standard TOS, not on a Falcon), you could try the freely-distributable
version of MetaDOS. If it works, ExtenDOS Pro will (the converse isn't
true!). Or send me the drive id reported by the ICD software, and I'll
tell you whether ExtenDOS Pro will work with it. BTW, if it's made by
Sanyo, you'll probably have problems (hate to bad-mouth a particular
manufacturer, but their SCSI implementation on at least some of their
drives is poor).

> Assuming I get my CD-ROM working, is there any way I can spurt digital

>

Yes, this can be done with the latest version of ExtenDOS Pro (v2.3A),
IF (and only IF) the CD-ROM drive supports it in firmware. Some do,
many don't. If you use the ICD software (or ExtenDOS Pro), they'll list
what the firmware in the drive reports itself as: it's a text string,
consisting of the manufacturer's name and the model number. Let me
know what it is & I'll tell you whether this feature will work, might
work, or won't work.

I think the list you're referring to is put out by Greg Kopchak
of "It's All Relative" in the US. Since it's several thousand lines,
I won't post it here. If you have WWW access, you can get it at
their web site, www.iarelative.com. It may also be available
on the usual FTP sites as CD_LIST7.ZIP.

This is a bug in the NEC firmware, and there is (I believe) a note about
it the READ.ME file that came with the 2.3A upgrade. It only affects
NEC drives, recording to Toshiba, Sony, Plextor is OK. Similar programs
on the PC platform have encountered the same problem, so I have some
confidence it's not just me!

I plan to add additional code (or perhaps a standalone program since the
amount of memory required may be LARGE) to try to fix this 'after the
fact' by detecting the duplication and bypassing it. Meanwhile, if
someone could persuade NEC to fix their less-than-perfect firmware
...... :-)

I believe I saw somewhere once about a small device that let you connect a PC keyboard to the ikbd input of an MSTe or TT. Does anyone have any information about this? Is it completely self contained PC keyboard protocol <-> ikbd protocol included, or is that done in software (i.e. hardware only converts PC keyboard hardware protocol to standard serial) I'm looking for a device that only converts the hardware protocol of a PC keyboard to standard serial communication. If such a device is unavailable, can anyone name the ICs that will communicate with the PC keyboard so that I can build such a device myself?

And uhm - I'm not too frequent on news, so please send any replies to me either to this address or to work (work address is prefered, since it is automatically also copied to home address so that it gets to me no matter where I am). Ta ta!

> reliable are the cartridges for backup purposes?

I bought a EZ-SCSI which is in an external box, but it was easy to
open the box and mount the drive into my falcon-tower.
It was very easy to get it started. You only have to set up the cables
right and start the machine and whips it was there.

I use SCSI-tools to format it into one 130 Mb-partition, but I have
tested ICD-boot and it works fine too.

You can switch cartridges on the fly. Just put it out of the drive and
insert a new one. It take about 5 second for the drive to be ready to use
after a switch (the cartridge must turn up to speed).

I cannot answer how reliable the cartridges is, because I bought the drive
recently, but they are about 1 cm thick and are stored in boxes.

Hello,

There isn't any problems for connecting a PC keyboard on a serial port since you can set the baud rate outside normal ranges. To bypass this problem, I've made a slight modification on the keyboard. There is a microcontroller on it. Its clock is generally made with an inductor and two capacitors. What I did, is to replace the inductor by a 4.9152Mhz quartz. It gives you a speed of 9600 bauds. The format is 1 start bit, 8 data bits, 1 parity odd and a stop bit. The other thing to do is to connect a TTL to RS232 level translator (MAX 232 for example) between the keyboard and the serial port.

Hope this helps.

Feel free to ask for further information.

Jean-Marie

P.S. It works only for reading datas from the keyboard.

EIDE drives work as well as standard IDE drives.
BTW, the Atari doesn't need any enhancement to cope with IDE drives > 500 MByte.
This is a PC specific problem.

Termination power must be supplied to a LINK or LINK II! AdSCSI+ get it's
power from the power supply in the Hard drive case, just like the hard
drive Mechanism that you choose!
> o "Bus arbitration": Same questions as for termpwr.
Now bus arbitration is something you WILL have to watch out for! ICD
Utilities won't handle bus arbitration, unlike some of the newer
commercial stuff from Europe, but even those won't let you use a drive
that needs bus arbitration as a boot drive! So don't get one of this type!

I will recommend a call to Toad Computers, or at least a look at their
Wwweb site http://www.toad.net for pricing and drive recommendations! I
don't know if they have the world's lowest price for hard drives, but any
one they sell you WILL work with your ST!

When I bought my 520stfm in '88 they all came with the aforementioned
single sided drives. It was a real pain in the ass, cos within a few
months Atari switched to all double-sided drives and software supplies
started drying up. As a cash strapped student I couldn't afford the
upgrade for ages and missed out on the glory years, only returning to the
dusty box on top of the wardrobe many years later when my soon-to-be wife
wanted to write an essay on it.

Why am I telling you all this?

Anyone want to buy a collector's item genuine Atari antique single-sided
internal drive, fully functioning (on one side only!)? All offers
considered:-)

Indeed, background printing is a current goal for the Behne Brothers and
me. I recently implemented multi threading in MagiC and that will give us
the power to do backround printing in a simple and efficient way.
BTW: MiNT is not capable of multi threading, so our solution will only
work with MagiC.

557. CAB and proxy

Newsgroup: comp.sys.atari.st
Date: 1996-04-09 00:00:00 UTC
From: andy@urban.prima.ruhr.de
Message-ID: <GDJOBIAFUP@urban.prima.ruhr.de>
Source record: 147492

Hi!

For some internal pages of my provider I do need to disable the proxy. The problem now is that disabling the proxy means to change the default.cfg and then to reboot which means to logon again ... :(

Is it possible to setup the default.cfg in a way that disables the proxy for special URL's? I know that PC-Browsers like Netscape can do that, so there should be a way to realize it with CAB as well, shouldn't it?

So - if it IS possible: please tell me how ... - If it is not: will it be possible to implement that in a later version? (*Please ...!*)

Thanks!

Maybe this is the bug I've found last weekend. It's possible that CAB
enters an endless loop if there's no more memory free. I'll release
a new version of CAB soon.

Look at my home page in about two days (it's still in German, but
you should find the update (CAB 1.1b) nevertheless).

: > The last thing the ST/TT/Falcon platform needs is more piracy, so please
: > do stop making it available, and if you yourself haven't registered, be
: > sure to delete any personal copies.

I don't think translating software _ever_ can be seen as piracy.

Why? Because by claiming so in this case, means that German- and
English-speaking THING-users are not treated equally! How can we
really accept this: only German-speaking people have the right to
try and use the shareware-test-version of Thing 1..?

It's silly, unfair and totally needless, I think.

I'm glad somebody _did_ translate this great product, so more and
more people have a chance to try it and register.

I'm sorry, if I hurt someone's principles by saying this - but we
should use our heads too, when deciding what _is_ piracy, and what
is not. By obeying the "word of Law" instead of its Spirit, we
only hurt ourself instead of helping..

Greetings,
T.

Moving a little off subject, with the first English version of MagiCMac it was possible to use Speedo Gdos without any difficulty but now with versions 1.22 and 1.25 this seems no longer to be the case, and I am stuck with vanilla GDOS. Is it a case of having to buy the MagiCMac version of NVDI?

>I have also read the vitriol that Ralph considers "reporting" and,
>since he owns STR, I will continue to avoid it.

At least you're honest enough to admit where you stand. But you are
still reading the magazine, at least on occasion. If it bothers you
so much, why read it at all?

>An oversight. Just as you overlooked mentioning that, as publisher,
>he _is_ responsible for guiding the editor(s) and thus has ultimate
>control over the content, even if he never writes a word.

No oversight - I mentioned it later on as you quoted me. My reaction is
still the same - that argument won't wash. It's a cop-out used to
paint Ralph as the ultimate villain in every bit of the magazine just
because he publishes it. We all take responsibility for what we do
with the mag; and no one hides behind Ralph's banner.

>I read it in its entirety. I found it far from humorous. Humor,
>however, is in the eye of the beholder. I'm sure there were many who
>found the concept of the Holocaust amusing. Chances are, those who
>were amused weren't Jews.

You're correct, humor _is_ in the eye of the beholder. Your Holocaust
analogy was a little over-dramatic, don't you think? I happened to find
it offensive due to my background.

>I would also point out that the entire purpose of the "humorous" piece
>was to detract from the ONLY American-made videogame console. An IMB
>plant in the USA was kept going to manufacture the initial run of
>Jaguars - as you should know. How many Americans are employed making
>Playstations?

I don't know what the _purpose_ of the piece was since Scott never
mentions it. I seriously doubt that his impetus for writing it was
to denigrate an American-made product. Yes, an IBM plant was utilized
to build the Jaguar - very short-lived. You ask how many Americans are
employed making Playstations. The answer: about as many as are employed
making Jaguars. BTW, I like the idea of buying American. It's getting
tougher and tougher to do so.

>I did. You don't seem to be dealing well with my catharsis. Ah,
>well.

No, I did deal with it. You used LeGrand's piece as a springboard to attack Ralph. He didn't report it, I did. Your aim was off.

>With Ralph, I make no bones. He's a blight on the face of the animal
>kingdom. With you personally, I have not seen any particular reason
>to quarrel. With STR, well - it's a wholly-owned organ of Ralph
>MAriano, and I know it, you know it, and anyone who follows this
>thread had better know it, lest they be led astray by the
>misrepresentations therein. I realize you have to make a living; I
>can only assume that STR pays your bills. We all have to prostitute
>ourselves in one form or another, unless we're lucky enough to be born
>to wealth. My particular shame involves which chip maker pays me. I
>don't feel the need to apologize for them, however.

You're entitled to your opinion of Ralph - I have no qualm with that. Your total disdain for a magazine just because Ralph _publishes_ it is a bit much, IMO. I took over the Atari reins of STReport. Other than an occasional editorial comment, Ralph has nothing to do with what I write. As an Atari user, and no quarrels with me personally, you have nothing to lose by reading _that_ section and ignoring all of the rest. Heck, I do that most of the time! <g>

Also, I don't make a living from STReport - no one does, and never has. STReport pays me nothing - never has. We're all volunteers and we do it because we enjoy it, at least most of the time.

>I'd be happy to drop this right here. It's up to you.

Why, I love a good debate. <g>

Rich Tietjens <starship@3rdplanet.com> writes:

>There aren't any "Atari creditors." While no one could honestly claim that
>the Tramiels have done much to market their products, the one thing they
>_have_ done is keep Atari on a "cash and carry" basis since JT bought the
>company from Time-Warner. That's why Atari remained in business, however
>small the business was, when Amiga rolled over and played dead.

Incorrect. Atari is STILL plagued with lawsuits from suppliers who are
suing over breach of contract (Atari promised purchases, but didn't
honor them). A look at any Atari corporate report confirms this. In
addition, Atari owes $45 million on bonds due in 1998, and has another
$20 million in sundry bank debt (I understand that the bankers are
extremely PO'd). Most of the institutions who lent Atari money (in
addition to individual investors) lent when the computer business was
on solid ground. No one could have bargained for what eventually
happened. At no time has Atari exclusively run on Jack Tramiel's cash
alone. In fact, Atari played with OPM every day (opm = other people's
money). Atari has many stakeholders who purchased stock, and lent money
and parts under the auspices of supporting an international computer
and electronics concern, not a company that gives borrowed cash to
resurrected defunct hard drive makers (JTS was called Kalok, and made
MFM, IDE, and SCSI units before it went broke before, and was renamed).
To say Atari hasn't screwed the consumer is blind. Atari has screwed me,
has screwed you (if you own any of their products from 1991 onward),
and screwed over 100 developers who were told of active advertising for the
Falcon "when it shipped." What about the consumers who bought Falcons
after Atari announced Space Junk, Llamazap, and other titles that have
never, will never, or only recently HAVE seen the light of day?
The hardware's great. The management sucks.

>small the business was, when Amiga rolled over and played dead.

Commodore closed because of PC clone losses. Most every drain on cash could
be concentrated down to massive sales drops in Intel boxes, while costs
remained constant. By the time C= got out of the PC marketplace, they
were already done for. Amiga demand was at an all-time high, but C=
lacked the cash to do it. Of course, they could have survived, but the
Commodore equivalent of Atari would have stopped PC clone production,
sold its headquarters, stopped Amiga development to save costs, stopped
supporting them after sales dropped off, and switched to selling the
CD-32 as a revolutionary system. Then, after CD-32 would flop, due
to unavailablity of games, it would merge with a calculator manufacturer.

>Oh, I don't demand impartiality. I demand Ralph's head in a silver
>charger. Of course, if one were to give his head an enema, it might fit in
>a teacup.

Why seeth at the guy? He defends Microsoft from criticism! Think about it
for a minute - here's a guy who makes his name by defending the status quo!
What a badge of honor!

> b> C) Ever wonder why Atari always survives catastrophes with large sums
> b> of cash? It's probably because none of that cash was invested in any
> b> marketing operations.
>
>It's because they don't owe anybody any money.

Not hardly, see any Atari annual report (or above), or look a recent (pre-
merger) American Exchange bonds listing. See also numerous lawsuits
alleging violation of supplier credit agreements.

> b> The sooner Atari Corp. is shedded and forgotten, the better for the
> b> long-suffering users!
>
>I can't argue that. There are other TOS computers now in production, and

573. Falcon IDE crash--Help?

Newsgroup: comp.sys.atari.st
Date: 1996-04-09 00:00:00 UTC
From: kenkast@delphi.com
Message-ID: <R5HIGjW.kenkast@delphi.com>
Source record: 147508

Help. In trying to install MagiC 4 on my Falcon shortly after getting it back from an FX upgrade, I put magic-booter behind Fx drive. When it booted up the system hung, and ever since I have been unable to access my internal drive. If I run ICD boot (I have the latest non-pro version) it recognizes the drive (a quantum 120). After that I can run Adhi and it will then see and allow me to install on the desktop the first three of five partitions, but trying to access them just gives me an alert saying "your output device is not receiving any data." If I run Edge after cancelling multiple bad boot sector messages, it will finally come up. If I try to install a new bootsector, it hangs. If I try to partition, it comes up with crazy beginning and ending sector numbers. If I then load my emergency mirror, the first partition reads right, and the sizes of the other four appear right, but the beginning and ending secorts remain the same and cannot be edited.
Any help and advice greatly appreciated.

575. STiK on TOS 1.0

Newsgroup: comp.sys.atari.st
Date: 1996-04-09 00:00:00 UTC
From: Garmonbozia <joelr9@nwlink.com>
Message-ID: <Pine.SOL.3.91.960409231716.7525B-100000@washington>
Source record: 147510

Hi there.

I am unable to run STiK. I am running TOS 1.0 on a 2.5 meg
520st. Whenever I try to load the accessory I get a two-bomb error (bus
error, I believe).
I had the same problem with the previous version of STiK and was
hoping that the update would solve the problem (if the problem is,
indeed, with the software).
I used the setup program to configure STiK. I also did it
manually with the same results.
Any ideas???

From: dhend@rmplc.co.uk
Message-ID: <829137300_OASIS_@rmplc.co.uk>
Source record: 147511

Hi all,

I've been trialling antmail for a bit, and if I had a decent text editor,
it'd be easy to use.

I have one problem though.
The messages that it produces don't contain all the necessary information,
reply-to, from etc. etc.
Basically it transmits only your e-mail address (and that's added by my
provider).

Anyone else had the same problem?

Yours etc.

David.

You mean a 85C30 chip. Because the NCR 5380 is a _SCSI_ chip.

>etc, just don't know of any software which will allow me to re-write it!

I've had this with some drives too, albeit always SCSI ones. If, as is the
case here, the drive manufacturers ID is screwed up by missing characters,
it is a sure sign of timing problems on the (SCSI-)bus. I've had Quantums
identify themselves as "UANTUM LPS xxxxxx" (first letter missing) and similar.
In my cases it was fixed by changing the hostadapter or cable and sometimes
even the drive itself. Note that it may be due to an _imcompatible_ hostadapter
and not neccessarily to a _defective_ one.(!)
As you say, it is an IDE drive so most of this may not apply. But try to
determine if the hostadapter is faulty anyway by using another drive.
And check the cable and connections.
But you can be sure of one thing: it's not possible to fix this with software.
It's a hardware fault.

592. Console window/shell wanted

Newsgroup: comp.sys.atari.st
Date: 1996-04-09 00:00:00 UTC
From: Andrew Thackrah <at@roe.ac.uk>
Message-ID: <Pine.OSF.3.91.960409102954.2814A-100000@reaxp01.roe.ac.uk>
Source record: 147527

Can anyone suggest a console _accessory_ (that I can run a command line
shell from). I use a 1040ST TOS 1.0 which means that I can't run Gemini
or other blitter-using console windows. If there are any TOS 1.0-friendly
programs to run Gulam/Mupfel in this way, they'd be ideal.

ttfn,
Andrew.

>the major search engines) use a different HTML command at this point,
>though I haven't spent much time investigating this. There is definitely a
>difference, and it's totally repeatable. One style of form will always
>work, the other style never works.

AFAIK CAB will send the first itemin the form, but not any others, so
fomrs like those at search engines, with only 1 field will work fine,
but ones with more than one field like futurenet registeration won't
work. I don't think its a different command, I think the authors
wanted to get CAB to work with Search Engines, so people could find
pages, and that getting registeration forms etc. is something less of
a priority.

>
>I think we'll have to wait for another CAB upgrade before the forms
>handling is improved; presumeably adding MAIL TO means also adding an
>e-mail option on clickable e-mail addresses, plus some kind of option to
>delay STiK from timing out.

I think this is what is required.... also knowing the mail server of
your provider and stuff like that !
>
>Meanwhile at least we've now got a stable web browser up and running -
>I've tried for weeks to get this one to crash and found it very difficult
>indeed, if not impossible. Assuming Guy's set-up prog works for your ISP
>it should be almost Plug'n'Play now!!

Thats the best of it, I think we have to remember that the WWW
packages is still under development, and seems to be growing at an
incredible rate !!! if there are bugs or features like form that

aren't fully working then we just have to wait... posting here though
may help the authors get an idea of what features WE as the users
rate as most important... maybe we should post our wish list here ?

594. Text Editor Recommendations

Newsgroup: comp.sys.atari.st
Date: 1996-04-09 00:00:00 UTC
From: phil4@phil4.demon.co.uk
Message-ID: <829151710_OASIS_@phil4.demon.co.uk>
Source record: 147529

I'm really looking for some views here:

I've been using a quite naff text editor for putting emails and news posts for quite a while now, and am looking for something quite new and nice to replace it.

The program must be able to work with Oasis, and really doesn't need to be a full blown WP, like say protext.

I'm looking for the following features:

i)PD/Shareware/Freeware (anything but commercial)
ii)Works with Oasis
iii)Loads fast, I don't want to have to wait round days !! (Nb. I do have a harddisk)
iv)easyish to use (not a major problem, but CLI types are out)
v)pretty fast, scrolling block functions et al.
vi)GEM might be nice

So if you are using a text editor that you think would fit some or all of the above, and that you would rate best text editor in the world, then let me know, what its called, and possibly if its pretty obscure, which FTP site I can get it from (which path might be handy also).

If I don't get many replies then I'll simply fo the searching myself, but I'm feeling lazy, and it won't really take you long to post an answer, so I thought I'd ask here first.

Thanks in advance

>

You may have to install one of the Serial port hardware modifications to get greater than 19200 baud on a plain ST/meag ST.

Look for a file called RSVE on umich; this gives 38,56 & 115 Kbaud.
Of course you can't get more than 56k out of a st/mega st, unless you have an accelerator card.

There is also a simpler modification, which only gives 38400 baud; this may be called 38kbaud (or something) & should also be on umich.

>

You have several options...

1. You could tar & gzip all the files, maybe they might fit into 32 Mbyte.

2. You could use Ghostscript (PC to atari serial linkup). This might be able to
run (on a TT) at 115 Kbaud. OK it's slow, but you don't have to be there
while it transfers. File compression would help.

3. According to the DOCS, BigDos should be able to read large PC
partitions, but it needs an XHDI complaint driver (of which I believe
HDDriver is one).
It does work (according to the author) but I don't know if it will work on
removable media.

I've tried accessing RTE's (Irish TV) homepage several times and it always
locks up with 'Converting image'. I've flushed the cache, reset the system
and it still occurs.

Could anyone possibly find out if it happens to them ?

I have for sale a ATARI 520ST+ computer
(HOLLAND)

With:
- 2.5Mb of memory
- 28Mhz speedup card built in
- hardware 386-DOS card
- 3.5" en 5.25" diskdrives
- harddisk 105MB
- HD and powersupply built in transparent case
- clock built in
- B/W and color monitors
- printer
- mous & joysticks
- books (Dutch)
- lots and lots of software (Prof. and games, more than you can
imagine!!!)
everything in good shape, and working properly.

The computer will be sold for any reasonable offer..

If you are interested mail me!!!

If the extender is .TOS then just double click on it, it will run as a
DOS program (usually) or it may unpack itself and you should see the
filename(s) displayed as it does so. The packers usually do this
themselves.

TTP also run as DOS programs but you have to type in a command line
which varies according to the archiver in use. Remember that the
current system path will be the one whose window is active (usually
the program you are running) so if the file to be unpacked is not in
the same directory as the archiver you will have to type in the
complete path including drive letter. Something along the lines of ...

-x a:\foo.zip

but read the archiver's docs for the exact command line.

>Are 720 dd's from my pc compatable,

Yes, provided it was formatted on the PC. Newer TOS versions will
format PC compatible but do it on the PC in case your TOS is one of
the older ones. Try to use DD disks, not HD ones, they can cause
problems.

>Also the drive will only format single sided 360k
>Anyone out there have a clue? Thanks in advance.

You clicked on "Double Sided" (80 track)?

If so, you have one of two problems ...

1) The ST has a single sided drive. Really old ones do. If you
can get the PC to format to the really old 360K format used on
5 1/4 inch floppies you might be able to get round it.

2) The drive is actually 720K but ones of the heads has stopped working. I mention this because I have had this problem. Provided the wrong head hasn't broken then you will in effect have a 360K drive, as the addition of the second head is the only difference.

To find out, get a reasonably large text file (containing just carriage return and linefeeds), 5 or 10K will do, enough to ensure both sides of the disk get written to. Copy it to a 720K disk then double click on the file and click on "Show". Press the spacebar to go down a page. If it gets displayed ok then you're in business. If not, try again with a 360K disk.

A double sided drive can replace a single sided one. Just plug in the drive and it will be immediately usable. Don't drop in a high density drive, it requires hardware modifications. Most PC DD drives can be persuaded to fit, just twist the ribbon cable 180 degrees.

1.I have a atari mega ste4 and a 486 dx4 75.
the main one is the 486 because there is the most software available.

2. The 486 last year.

3. A Sillycon Graphics.

Good luck.

Source record: 147376

Hi Bjorn, on 07 Apr 96 you wrote:

m>
m> My friend owns an Atari 1024ST and is about to buy a HP DeskJet 500C. I
m> believe the printer is a PCL printer with no Epson emulation
m> capabilities. Is it possible to use such a printer with the ST?

That's all correct. Many people have used this printer with the ST for all
sorts of applications.

m> What (if any) printer drivers does he need, and where can he get them.

All modern software will come with drivers for this printer.

m> He will use ST Word for word processing (bundled with the machine).

ST Word is particularly old and never had printer support beyond Epson 9-pin
printers. It does, however, have a utility called CONFIG.PRG which allows
you to edit/create new drivers if you know the printer commands to enter for
formatting and text effects. Perhaps it'd be a good idea to grab a printer
driver for another word processor (like First Word Plus) from a PD library
and crib the necessary commands from there.

Also, I'm not entirely sure whether ST Word will allow printing of Images
within documents - First Word Plus needs a separate utility to do so so
perhaps ST Word does as well.

Upgrading the word processor to something like Protext v6.61, That's Write
3/4 or Papyrus Gold will get around these limitations (with the possible
necessity of requiring a memory upgrade and the purchase of NVDI/SpeedoGDOS
as well).

Also, Fujitsu M2684S which is the the same as the M1603S,
but older. No problems on my FALCON. Term pwr is set by patching
what you want. The 'Bus Arbitration problem' is not a factor on
BOOT.

620. Re: Strange Happenings

Newsgroup: comp.sys.atari.st
Date: 1996-04-10 00:00:00 UTC
From: BobR <76702.1466@CompuServe.COM>
Message-ID: <4kh75h$93t$1@mhafn.production.compuserve.com>
Source record: 147378

The first runs of the 520STFm had Single Sided (360K) floppy drives in them.

If that's the case, swapping floppies with a PC will be impossible unless
you can convince the PC to format single sided. I'm not sure that newer
versions of MS-DOS can do that any more.

As was mentioned, replacing the single sided drive with a double sided (720K)
drive is easy and should be the first thing you do (other than getting a
hard drive system).

As for unarchiving files, while you should eventually work out the process
for doing it on the ST, you CAN use the equivalent DOS programs to unarchive
the ST files onto a floppy.

For .ZIP files just use PKUNZIP... for .LZH files use LHA.EXE... for
ARC files use ARCE.COM

Source record: 147379

>I've asked this befoer, and come up dry, but I'll try again.

The reason you came up dry is because formal docs for atarinos do not exist. The program itself was compiled (with some neat extensions) from the pc version source code (ka9q) and the associated (pc) docs are included with most of the available versions. Bear in mind the work was done bu David Nash along with some other demon internet atarians and AFAIK none of them made a bean out of it. The docs are a real pain aren't they.

Most of us solved the problem by getting hold of someone else's startup.nos and dial.txt files and then editing in the necessary details of our personal accounts. If you know someone else using nos with your provider that is your easiest option.

Otherwise ask for help in here or demon.ip.support.atari and someone cleverer than me will help you get sorted.

Don't be too despondent - oasis2 will soon be released and that comes with good docs and a configure program.

Best wishes

Neil

Source record: 147383
Cross-posted to: demon.ip.support.atari,comp.sys.atari.st

Having had a few lock-ups when CAB retrieves GIF images, I checked through the main HTML code for the pages and found that the tags include sizing controls - ie width and heighth percentages.

Is it because of these that the lock-ups occur ?

Yours suggestively,
Andrew

If it's anything like the STF; atari left off the 'Drive B' select signal
from the internal cable on the floppy drive. The 'Drive B' select does
however appear at the external floppy port.

Does the TT have one of these; if so then you should be able to wire this
to the internal floppy cable.

You will need the pinout of your floppy drive to figure out which is the
right drive select signal. Sorry, I don't have this to hand, but it might
be in the 'Chips XXX' file that's on some archive sites.

Hi Jyri,
I don't remember the model number, but the SLM804 is in fact a TEAC and there must be toner and drums that are made for this TEAC printer that fits the SLM804 too...
If you need to know about more parts, I believe you can get some help from Mr Data AB in Stockholm, Sweden (I don't know of any retailer in Finland, so Sweden would be the closest). The man to talk to is Per Olofsson and the phone number is +46 8 6500680, fax +46 8 6500670.
I believe you can get most spare parts there too.

Best regards,

Claes

Well, it's time to sell my Quantum LPS 105 as it was replaced by a 1.3 gig drive. This would make a great internal drive for a Mega ST. It's SCSI (of course) and only 1" tall. Runs perfect with no bad sectors. Has been in my Mac so will need to be re-formatted. Make an offer as this drive must be sold.

Colour Deskjets like the 500C (CMY only) or 550C upwards (CMYK) have been
popular for a while and will have GDOS and Speedo drivers available. You
might consider the 560C which *I think* is the last model that has a front
panel for you to change settings manually (although there's still the HP660C
driver and CPX available).

Alternatively, there's the 720dpi Epson Stylus which is supposed to be
excellent with Imagecopy, but not specifically supported by GDOS or WO

h> on their keyboards? Are they still available?

These are called KeyClicks and are available from System Solutions in the UK
@19.95ukp - alternatively, Toad will probably have them in the US.

They're supposed to be quite good in operation but a right pain to fit.

Gr> appreciated....I'm not on line often.

You need a special drive chip to run a 1.44 meg drive on an ST, I think
a few ST companies still sell them, such as System Solutions.

636. Re: Atari corp.

Newsgroup: comp.sys.atari.st
Date: 1996-04-10 00:00:00 UTC
From: Spencer@mettav.demon.co.uk
Message-ID: <11616_Spencer@mettav.demon.co.uk>
Source record: 147394

Out of the ether, the following was mentioned by asmolar@smol.fast.net...:

a> Nothing really, Originally Atari was going to use CPM-68K for the
a> ST's OS, but they found it was too slow, so they quickly produced an
a> OS that was internally based alot on MS-DOS. Instead of a command
Errr, TOS is actually based around CPM/68k. Both CPM/68k and GEM came
courtesy of Digital Research (remember Gary Kildall wrote CPM for the hell of
it and started Digital Research by accident!)

a> than MS-DOS, and seems a bit more stable thatn Windows though. (But
a> that's not saying much) I've used it for 9 years, the best compliment
Well I must say its much more stable than Windows though possibly not as
functional. But it is a hell of a lot easier to program than any of the
Windows versions!

a> OSes do. But just to show that it isn't great, look at all of the
a> stuff that replaces or patches TOS: Replacement Desktops, replacement
a> graphics routines
a> (NVDI, WARP 9, etc), HSMODEM patch, Multitasking Replacements (Geneva,
a> Magic)
a> File selector replacements. The list goes on.
Begins to sound like PC's, or the Amiga or even the Macintosh!! ;-)

No environment is ideal, if it were we wouldn't be having such an argument.

One beauty of TOS is that people are able to write and develop patches when
they perceive a need.

I have the following ST items for sale:

Software:

Magic Fly (Electronic Arts) -great 3-D type flying game.
Chaos Engine (Bitmap Bros.) -cool overhead shoot-em-up.
Wish I still had my ST to play
this one.
Cruise For A Corpse (US Gold) -wonderful graphic
adventure game...
sadly, I never solved it!
Test Drive (Accolade) -a classic game.
Clue :Master Detective (Parker Bros.) -name says it all.
A.P.B. (Domark) -good adaption of the arcade game.
Highway Patrol II (Titus) -took me years to figure how to
get this game to work. Fun once I
figured it out!
Tennis Cup (Electronic Zoo) -nice tennis game...wish I
had one for the
Falcon.
Dungeon Master (FTL) -you mean you don't have this game?!
Super Space Invaders (Taito) -you'll love it if you liked
space invaders.
Treasure Island (Windham Classics) -dorky game but is
great for the kids.
GODS (Bitmap Bros.) -best game I ever played on the ST.
Art & Film Director (Epyx) -nice paint and animation package.
Advanced Art Studio (Rainbird) -paint program.
Dive Bomber (US Gold) -nice flying/mission game.
Death Sword (Epyx) -mortal kombat tooks its cue from this
classic.
Impossible Mission II (Epyx) -interesting climber.
Battleship (Epyx) -good adaption of the classic game.
Championship Wrestling (Epyx) -wrestle your heart out.
Sub Battle (Epyx) -a game which is quite in depth.
Starglider (Rainbird) -classic ST game...
World Games (Epyx) -get into the olympic spirit early.

Books:

C-manship Complete by Clay Walnum -great book for those
wishing to learn
C on their ST.
Compute!'s VDI Reference Guide
Learning C :Programming Graphices on the Amiga and Atari ST.

Programmer's Guide to GEM

Misc:

Xformer Cable to hook up an 8-bit drive to your ST.

Make me any reasonable offer.

639. Need poop on Atari ST graphics modes

Newsgroup: comp.sys.atari.st
Date: 1996-04-10 00:00:00 UTC
From: jdm@netcom.com
Message-ID: <jdmDpnsrG.DAK@netcom.com>
Source record: 147397
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Can someone give me an explaination of the graphics (not text) modes available on the Atari ST? I'm reading through some file format specs for the Atari ST (NEO, PI, PC, TNY, etc.) and I see mention of low, medium, and high resolutions, but nothing on the size and pixel depth of these resolutions. The standard screenshot size seems to be 320x200, but the Atari FAQ lists 320x192 as a standard graphics resolution. The FAQ also does not explain "overscanned" and "underscanned" modes. I assume this is how Atari achieves 640x200x4 resolution?

Somebody care to enlighten me? Thanks much.

Source record: 147401

TG>Argh! It only runs in 640*480*16, and not even on graphics boards :-(.
TG>I'd like a GEM version of that.

That's wrong. Just set the XBIOS(4) function to the value of 4. With this little patch SoftPC runs on my graphics card on a resolution of 1024x768x256 (But only in the upper left corner with the original 640x400-display supported by SoftPC).

TG>>Also you need DOS aswell (preferaby v3.3)

DOS 6.22 does also run. Even on an Afterburner :-)

TG>Does Novell-DOS run?

Don't know anything about that.

644. Tos 1.4, That's Write 1.51, Harlequin Config -- 'cannot find standard.key'

Newsgroup: comp.sys.atari.st
Date: 1996-04-10 00:00:00 UTC
From: peternm@sn.no
Message-ID: <06Abx0FDAG3a090yn@sn.no>
Source record: 147402

This post is based on a longish phone conversation with my aspiring writer friend who recently aquired a Mega ST 4. I have little experience with Ataris, but I agreed to try to find a solution anyway. Here's what happened:

My friend (Eivind - that's his name) has a Mega 4 ST with two floppies. He got the machine from a friend, along with literally hundreds of floppy disks with various software. With a little help from friends, he has been playing with his setup. I got him a copy of the 'Your second manual' shareware (or is it freeware?) book.

After reading Y2M in its entirety, Eivind booted his ST with a TOS 1.4 boot disk that was set up with a ram disk (d:), and played around with various tools and accessories. It all seemed to work fine, until he used the Harlequin config program to edit his keyboard definition. He saved the keyboard definition file (standard.key, I think) on the D: ramdisk. Eivind has his heart set on using That's Write 1.51 for his writing, but after that last config change, he can not start That's Write after booting with the TOS diskette that contains his preferred setup. He gets a message saying 'cannot find standard.key' or words to that effect in a dialog box that contains only a 'Cancel' button along with the message. The only way he can start That's Write is booting from the That's write program disk, which of course leaves him without the ramdisk and the other stuff he'd set up.

The funny thing is, the exact same thing happens when he boots with his untouched copies of both the system diskette and the That's Write disk.

That made me wonder, is it possible that some sort of vital setup information stored in non-volatile RAM has been altered by the Harlequin setup program? That is, 'if the machine detects a d: drive, it will refuse to load its standard.key from anywhere else'?

Does this sound familiar to anybody? As I said earlier, I do not really know my way around on Ataris (my experience is more in the Dos, Mac, Win and Unix area), but I _do_ know the feeling that hits when one silly mistake ruins a lot of work that started to look very promising. I (and Eivind, of course) would be very grateful for any tips.

-Peter

There is a difference between these two family of fonts :
the number of symbols which is higher in Type 3 than in the type 2.

Despite of this, they are generally compatible.

The main problem is not being able to use device drivers i.e VGA,HiMEM,ANSI etc so you are stuck with CGA graphics and 640K ... not very useful for running any recent stuff , but good for some fun running ancient PC games :-)

Yes, I have an ST 3600N in my computer, running from an ICD+
Scsi. I just pulled out the old one put in a new one, and ran.
(After formatting, of course.) The only problem you may have with
the 3600 is that it is a 1/3 height drive. You may need an
adapter bracket. look up http://www.internet-cafe.com/hi-tech/
on the internet. They have current prices all the time,
and often offer specials. A couple of months ago I got a
28.8 external modem for $99!!!

Not really. You can not run Windows 95 , but I run some very
expensive music typesetting software ($700). I can run now many
DOS applications like Word Perfect etc and any text editor program
runs at a good speed.
I also use Norton Comander so I do not have to type all those
DOS commands. Some one needs to create a module or something
to make it use the DSP. The program is very solid and I am gals
to have it.

I got several DOS programs in their boxes from a friend next door.
Norton Commander is in color and uses GENM like menus and the
mouse.

I can print and use the mouse under SoftPC but have not figure
out the Modem ports yet. If I do I can also use DOSFAX and COMIT
Both are very Recent IBM programs.

I agree it would be impractical to try to play games on SoftPC,
but is was not crested for that anyway. It is a great program and
tool and every one should get it from Compo'CD.

Portfolio Club (UK) Atari Portfolio Users Group. Primarily a PD
Paul Finch club for software to connect to STs and PCs,
16, Cedars Road they've now secured stocks of hardware and
Malden, Surrey have contacts in both Canada and Germany for
SM4 5AB new products.
Tel: 0181 542 8350 ST user computer support as well.
Email: finchp@parliament.uk

==========
15th March 1996
Dear Portfolio User,

Hello my name is Paul Finch. I thought you might be interested in the news that I have started up a club for owners of the wonderful Atari Portfolio pocket PC computer, my records show that you have/had one of these machines, so you can be one of the first people to be invited to join this club. There are approx 300 Portfolio users in Europe alone. This club is therefore part of a much larger group.

Membership is FREE to join just fill in the enclosed form and return it with a PC/ST formatted disk and S.A.E. On receiving the above I will put onto your disk a copy of my CLUBDISK, my current PD software list of over 300 programs plus my FOR_SALE, a list of my new and secondhand hardware.

I have contacts in U.S.A, Canada, Germany and Czech Republic with supplies of new items for your Portfolio, i.e. Memory cards, Interfaces, floppy drives. Did you know, it is also possible to backup your data on to a standard tape recorder, upgrade your existing Portfolio to work faster or have a larger internal memory, even have the internal battery backup increased from 10 minutes up to 24 hours!

It is also possible to work your Portfolio as a fax machine or have a individual copy of your Portfolio working program on your desktopped P.C, even a way to transfer data between an Atari ST and your Portfolio. Yes this is all possible with software from me.

You will also be able to read on disk, in my CLUBNEWS about the range of magazines, newsletters, old and new, yes there is a very good newsletter currently being produced in the Czech Republic and its in English. Also a copy of my club's HISTORY on disk.

So hurry up and fill that membership form in today and post it off to me, remembering to enclose that disk and S.A.E.

P.S. In about six months time I will send out a list of ALL members, so you can contact fellow Portfolio users for help, tips, etc.

Yours faithfully,

Paul Finch

HISTORY

For approximately three years there was a very well run club called `Portfolio Connection' in the U.K. Then at the end of 1994, Mr & Mrs P Bennett who ran this club moved to the U.S.A and this club closed. With the loss of approx 1000 P.D disks! This is where I come in, by trying to resurrect this club.

To date I have most of the P.D disks and also a data base of members, I wish I could run it like the old Portfolio Connection but I already run a swimming club and work 6 days a week so I would not have enough time by myself. So my club is mainly a message base at the moment, but I am willing to help anyone else get the old club up and running again or stay just being a message base, to put people in touch with each other.

I am on the look out for buying and selling any new/second-hand hardware and software, Computers, Memory Cards, PC Card Drive, P.D disks or newsletters/info related to the Portfolio. Please let me know what you have for sale/exchange and its price.

Mr P.H. Finch. 16 Cedars Road, MORDEN, Surrey. SM4 5AB. ENGLAND. U.K
Telephone:- Home:(001)0181-542-8350. Work:(001)0171-219-4768

Rich Tietjens <starship@3rdplanet.com> writes:

>There aren't any "Atari creditors." While no one could honestly claim that
>the Tramiels have done much to market their products, the one thing they
>_have_ done is keep Atari on a "cash and carry" basis since JT bought the
>company from Time-Warner. That's why Atari remained in business, however
>small the business was, when Amiga rolled over and played dead.

Rich, that is not what Synapse says...the old SynFile, SynCalc folks who went belly up when Atari failed to keep their promises of developing a product and "paying" for it. Synapse got taken over by Sierra On-Line and there was an article by Roberta Willa
iams in one of the Sierra magazines about why that and other thins meant Sierra would not develop anymore for the Atari. JT is NOT a lilly white knight in this. As for the humorous article, some of it WAS funny, some of it wasn't. The intersting thing

was how much of it was right on ... two years later.

Take care now and don't burn the place down (Houston is still too dry for hot tempers <g>)

>hardware only converts PC keyboard hardware protocol to standard serial)

Gard,

Keyboard Gizmo from ChroMagic Software Innovations is a hardware add on that will add a PC keyboard to ANY ST .. I just got one and plan to adapt it for the TT. The PC board they use in fact not only lets you add a PC keyboard, but a PC mouse (serial mouse), an ST mouse, and 4 joystick ouputs (I think it's 4, could only be 2, but I'm too lazy to walk across the room and look at the board).

You can reach ChroMagic at 417-623-7393 (516 N Jackson, Joplin MO, 64801-2755, USA) The keyboard gizmo sells for $79 US

The most adaptive shareware program is the Midi Music Maker (it lets you play on the internal speaker if you have no sequencer). The latest version is MMM221. Another good player is PLAYBACK and SMF_PLAY. All are available at most FTP sites of any size...try the Toad site.

If anyone has advice or a copy of a utility program that will convert
HabaWriter files to ASCII, 1stWord Plus or any other standard format, please
drop me an e-mail note if at all possible.
I have a program called "homeAccountant" that only writes HabaWriter files and
I need to save in a useable format since I don't own a copy of HabaWriter.
Anyone have a copy of HabaWriter for sale????

658. Atari 520 ST & stuff for sale

Newsgroup: comp.sys.atari.st
Date: 1996-04-10 00:00:00 UTC
From: gkomatsu@Hawaii.Edu
Message-ID: <DpMJDE.H2I@news.hawaii.edu>
Source record: 147544

I have an Atari 520 system for sale. Workability is
questionable for the drives. The computer and monitor appear to
work fine, but the disk drives refuse to be recognized. (and I
have no software for this.)
Send offers for any or all the parts, though I'd prefer to
sell the mouse and power supplies with their appropriate part.
Buyer pays shipping (or I'm willing to split it depending on the offer)

Atari 520 ST and Mouse
Power Supply
SF314 3.5" disk drive
power supply for disk drive
5.25" disk drive of unknown brand (metal case, "half height" and about
a foot in length, power supply contained within)
cables to hook up disk drives
SC1224 Color Monitor

You can still do it with your control panel..

> 2. Your version of the system crashes for me when I open a second window.
> With 100E, 100G runs fine, except I dont understand what it says.

Don't worry, 100e and 100g have the same bug. To avoid this problem
don't ever select "adapt automatic size" in setup/windows/ menu.

> 3. It seems that neither 100E or 100G saves what windows are open
> for the next reboot. If I understood it right the old version kept
> a thing.tmp file that saved that info from one boot to the next.

You're right I didn't find any option for that.

> 4. Since the STGuide docs are still in German, I cant figure out how
> to fix up th icons, and select others.
> 5. I am not sure what variation I tried, mixing your system and 100G, but
> I can now get it to work almost right. Have you had any other reports of
> maybe a busted file?

All the files are the same, I changed only the icons.rsc , icons.rsc, and
Thing.rsc. That's all. It runs very well on my falcon and on my mega ste.
Just don't select "adapt automatic size".

> 6. Do you know why there is no thing icon prog? the old version SEEMS to
> work at first glance. I see you put in a pretty recycle icon in yours.
> But so farwith my mixed sources, I cant get it to load. Can one simply

> edit the *.inf files longhand to get it to work? I gather that is what
> thingicn.prg is supposed to do?

Thingicn.prg was not on thingv1 so I didn't put it, because maybe the authors
don't want it. By the way if you want to use the recyclable trash,
Just drag the file rt.prg on the desktop, and rename it RECYCLABLE.
And if you want to use thingicn.prg you still can use it as a tool or
directly in the window.

> 7. Is there a public domain, or publically available (gdos, NVDI, Speedo,
> or eqivalent) shareware program? I'd love to try the other fonts, but don't
> know yet whether I want to buy them sight unseen.

You can get via ftp's a GDOS prg. I think AMGDOS.PRG or something like
that . And if I could suggest to you the best buy for your computer, I'd say
get NVDI now!!. It is so good...it speeds the machine wonderfully.
Everything is faster. And it can control the fonts, and now with the latest
version you can also control the speedogdos font(vectorial).

> 8. I saw the csas note from that a******e complaining about your translation.
> I say, "Congrats"!!!

I say "Thank you", you may know that it took me a while to do this
translation. And for the a*******e .I wouldn't say that, I think he might
be right. I should have asked the authors for the translation,
but it seems to me that I did a good thing for atari users, knowing
that it is not a cracked software, just a translation.
And it still seems stupid if the translation was only for
register users. I couldn't understand that. And the thing is that
after the translation, a lot of new users would like to register, because
they finally can use this EXCELLENT software.

> If this works right I will register. It would be fantastic
> if the docs were translated. ST-Guide is of no help because one can't

>(Washington DC)

I have one. It's stripped down to one meg. The hard drive stopped working and it had a power supply problem. It's got Tos 2.06 roms though and I'd like to keep that.

What would you offer for such a thing? I would figure shipping on about $10.

661. Fine-tuning the ST clock.

Newsgroup: comp.sys.atari.st
Date: 1996-04-10 00:00:00 UTC
From: jhovila@muikku.jmp.fi
Message-ID: <4kfq0e$mpt@teeri.jmp.fi>

Is there any way to fine-tune the battery-operated clock of Mega 4? In my case it's quite a lot too slow.

- Jyri

662. Maximum speed with HS-Modem 6..?

Newsgroup: comp.sys.atari.st
Date: 1996-04-10 00:00:00 UTC
From: jhovila@muikku.jmp.fi
Message-ID: <4kfqb7$mpt@teeri.jmp.fi>
Source record: 147548

Might be a stupid question, but...

Should it be possible to speed up the serial port of Mega 4 to 38400 bauds using HS-Modem 6? I've got Supra FAX-modem V.32bis and Connect 2.46. When HS-Modem is installed, I can change the serial port speed to 38400 bauds, but that makes my modem crazy, and drops the actual speed to 300 bauds or so..:(Any help will be appreciated!

- Jyri

663. Transferring >32MB on EZ135 between Atari & PC

Newsgroup: comp.sys.atari.st
Date: 1996-04-10 00:00:00 UTC
From: "Dr S.G.K.Williams" <williamssg@cf.ac.uk>
Message-ID: <Dpn2HM.5Jp@cf.ac.uk>
Source record: 147549

Having partitioned a syquest ez135 cartridge into 4x32MB partitions using a PC, it seemed to work on the atari as well, though a but sluggish for some reason.
I've been told that BigDOS should enable me to access bigger partitions on both machines, I need to transfer some "big" animation and video files between a PC and the Atari. Unfortunately, I haven't had any success with Big DOS at all! Can anyone help, or offer some advice on how to interchange 135MB single partition between different platforms? I'm using HDDriver 4.51 and have a TT with internal scsi harddrive and syquest ez135 connected to the scsi external port.

>somewhat of a novelty and one with both carts available at the same
>time (like the 660c) would be far better. Get a PC mag' and see what
>is out there.

Thanks Paul for the info/advice - much appreciated.

I think the 600c is the one that fits the bill nicely. Escom in Swansea are offering it for 230 GBP (!) inclusive, so my Father is going for it. AW in AW gave it a good review with the caveat that Atari owners probably won't be able to access many of the advanced features, but even so, I think it should do most things my sisters need to.

I've currently got a HP Laserjet 4L, which is pretty good for what I need. I had a Deskjet 500 for four years and it was excellent. It has now been pensioned off, but still gets used by one of my mates who has it hooked up to a PC (sorry printer!), and it still runs fine.

Mind you, my Epson LQ400 is still as good as it was nearly six years ago when it was bought new! It just keeps on going, with no hassle at all!

How much overhead is just removing the top and bottom boarders?

I have a source code for this demo that can do this in 50Hz mode and
I want to put this in a game I'm writting so it'll automatically do
overscan on European machines. I appears that I have to keep
accessing the routine with each vbl. The game is in STOS, but I can
use assembly rountines with no problem. Is there anyone who can tell
me more about it? Thanx

Bonjour a tous,

Je viens de mettre a disposition de tous un de mes logiciels :
Eureka 2.12. C'est un logiciel de trace de courbe 2D et 3D qui
fait office de modeleur mathematique. Il permet aussi l'analyse
numerique de donnees. Il est disponible a l'adresse suivante :
http://www.ief.u-psud.fr/~lecoat/
Ce logiciel est un free-shareware-ware. C'est a dire que les auteurs
de sharewares sont encourages a m'envoyer leurs productions en me faisant
grace de la contribution. C'est important pour moi de savoir ce qui se passe
dans le domaine publique, et les auteurs ne sont pas toujours facile
a retribuer ... Les explications se trouvent dans "eureka.doc".
Les auteurs de freewares sont aussi les bienvenus s'ils souhaitent
m'envoyer leurs logiciels.
J'espere pour les personnes qui n'ont pas acces au WEB, que mon logiciel
sera bientot disponible sur le serveur du CNAM par ftp. Dans tous les cas,
celui-ci evoluant beaucoup, la derniere version se trouve sur ma page.
Pour tout renseignements, s'adresser par mail a l'adresse :

lecoat@ief-paris-sud.fr

IIRC you set up part of your config (so long ago since I did any point
stuff, I've forgotten it all :( ) file so that the relevent section of
change mail flavour commands gets executed, basically by specifying a flag
on the command line to execute that block of commands in your config file.

> to create a dummy crashmail packet to trigger Bink. You'll need to have
> the crashmail flag set in BINKLEY.EVT, too, or Bink will ignore them
> anyway.

Yeah, you basically want it to only send crashmail packets during off peak
times or if you have an alotted time to collect mail from your boss node.

677. Need help with GFA and files !

Newsgroup: comp.sys.atari.st
Date: 1996-04-11 00:00:00 UTC
From: phil4@phil4.demon.co.uk
Message-ID: <829328392_OASIS_@phil4.demon.co.uk>
Source record: 147113

Does anyone out there know how to do the following:

Get the directory listing in a string array ?!

So far I've tried DIR and FILES, but both only write direct to the
screen, or to a file, which I could then read back in.... but this is
SLOW, especially when using a floppy disk system.

what I'm looking for is the equivalent of

files$()=DIR "C:*.*"

or the long way:

```
DIM FILES$(10000)
FILES "C:\*.*" TO "C:\FILELIST.LST"
OPEN "I",#1,"C:\FILELIST.LST"
FOR N=1 TO 10000
LINE INPUT #1,FILES$(N)
NEXT N
```

Any suggestions ??? I'd be really grateful !

Thanks in advance

This solutions ok if you've got the PC setup next to the ST a lot of
the time, however I think unless you have a fast serial port, Floppy
disks are the cheapest and fastest way.

>> g> Unfortunately, floppies written by an Atari seem not to be readable.
>> g> Is there any known procedure to transfer data as described?

Try formatting the floppies on your PC first and then putting them
into your ST, this is about 100 6kely to work ok.... however yuou
must make sure that the disks are formatted to the right size, that is
most likely 720K, Double Sided NOT high Density. You can do this from
DOS:

FORMAT A: /F:720

if these disks don't work then try

FORMAT A: /F:360

as you've got a single sided drive.

Now copy the data on the Atari onto the floppy disk (DON'T reformat
it, or change the bootsector in any way (virus killers etc.) otherwise
it will be unreadable in the PC, and then lot it back into your PC and
read away !

Nb. AFAIK PC viruses will not have any damaging effect on the Atari,
and vice versa (for the same reason you can't run Atari progs on the
Pc, and vice versa, the viruses (mini programs) can't run on the

iother computer).

If you have problems with this then you can get back to me and I'll go
through it even more detail....

ATb.

The program is called Doubler 2, and was on an STF coverdisk.... I can
find the number if you really want. Also I think it was on FTP sites,
like Umich or the mirror at SRC.DOC.IC.AC.UK in the Umich mirror.

If the person posting this question can't be bothered to serach for
the program, I'd be happy to email him a copy, if he can cope with
UUencoding. If this is best for you email me:

>28.8 if STiK only goes to 19200??
>
>Any ideas?

Use the modem control cpx & set the baud rate to 150, 8 bits, 1 stop bit, & no parity. In the DIAL.SCR for STIK set the baud rate to 115200. You also need hsmodem (& the hardware mod if using an ST). As to the rate (in real terms) you get, who knows? It's quite fast but there's no way of timimg it. Seems to load GIFs (10-20k) in less than a minute but then spends as long converting it, timings are purely subjective:-). (Dunno why they call it NET surfing, more like messing about on a boating lake, but there again baud rate may be a mispelling of bored rate).

MEGATYPE's TYPE ONE converter was supposed to be upgraded to convert True Type fonts to ECF format then requiring FONTVERTER to convert the ECF to Calamus and Pagestream formats. I have both but never recieved an upgrade. Im not even sure that one exists since the author ignores everyone.

Other than that I know of no other program that will convert True Type to Calamus format. Type One fonts yes.....

686. A few dumb questions

From: dand1@azstarnet.com
Message-ID: <4ki7ou$756@news.azstarnet.com>
Source record: 147258

So I wound up, by a quirk, with this neat-looking Atari system but I have a few problems. This looks like the place for answers.
The system consists of a console which says 520 ST on the top. On the bottom, it says STm. The monitor is a SC1224 and the disk drive is a 3.5 floppy, SF354. There is also a mouse, of course
Problems/questions:
1. I have no discs. Do I need a system disc, or what? If so, where might I find one?
2. Is this sytem worth working with at all? It does come up with a screen with drive icons A and B and a little menu bar at the top. I can change screen resolution,etc. The mouse works,etc so I believe it is operational- just wonder if it's worth much effort to get into full swing. If it is, where might I get the manuals, etc to accomplish something?
That's enough for now. I appreciate whatever counsel any of you experienced Atari people might have for me.
Thanks,
Dan Dotson

You have to format your drive under DOS, not TOS, in order to use it on
both systems.
Please be more specific: What was it that didn't work?

It will work with removable media, too, because BIGDOS doesn't have to care
for media being removable or not. No software except hard disk drivers needs
to know the difference between removable and non-removable media.

691. Atention CAB/STIK/ANTMail really works this way.

Newsgroup: comp.sys.atari.st
Date: 1996-04-11 00:00:00 UTC
From: afn14016@freenet.ufl.edu
Message-ID: <4kifir$d62@huron.eel.ufl.edu>
Source record: 147263

Hi friends: I got mail from a friend from Poland saying that he got WWW130 from my Falcon/ST Yellow Pages. He also said that he was sending the mail using ant Mail and that CAB/STIK/ANTMail worked perfectly.

I was very interested in his set up so I asked him for the config. files. He sent them very fast and I his set up on my Falcon.

the friend from Poland is Andrzej Michalski (thanks :)

Well, I tried and tried and WWW130 just did not work. Also I got nothing from ant Mail.

Then I remembered him saying that he was using the old Stik/CAB because he was "to lazy" to do the set up again.

Well let me tell you, I got my old copy of Stik and CAB from WWW116 and Now every thing works like a beauty. I was connected with CAB and downloaded pages and pages with lots of graphics and CAB always loaded them really fast and with no problem.

Also while on CAB I also had Ant Mail loaded and I was able to send and receive mail very fast too and way faster than PINE.

I do not understand whyb it works but it does work perfectly a, and I am keeping this set up.

CAB 1.0a
Stik 1.07
AntMail 0.7.4

also I enhabled the Data flow on my Modem (AT&F3)
and are running under Geneva.

So, I hope you get it working soon and when you do send me mail from ant Mail:-)

Raymond. I will include here the Stik config.

692. Cubase - Mixer map for Korg 01/W

Newsgroup: comp.sys.atari.st
Date: 1996-04-11 00:00:00 UTC
From: Ivana Mesec <ivana.mesec@guest.arnes.si>
Message-ID: <316D3597.1E68@guest.arnes.si>
Source record: 147264

Does anyone have a mixer map for a KORG 01/W or something compatible.
I have Cubase Audio for Atari Falcon 030.

Thank you for your cooperation!

Well, of the above mentioned OSs XaAES and oAESis are _free_. And even
the sources are freely spread, so you can contribute to the devoping
effort if you will!
When XaAES and/or oAESis is ready, almost all of the Atari's OS is
free and sources available. That'll be cool :-).
```

>standard graphics resolution. The FAQ also does not explain "overscanned" and
>"underscanned" modes. I assume this is how Atari achieves 640x200x4 resolution?

>Somebody care to enlighten me? Thanks much.

The ST has 3 "normal" modes :
- 320*200*16 colors (ST Low)
- 640*200*4 colors (ST Med)
- 640*400*2 colors (monochrome) (ST High)

The Overscan Modes use special techniques to increase the resolution
available. The problem is that there is several different technics
which do that but they are not (all) working on every STs.
In fact there is not a lot of graphics format which use such technics.
There is the .KID format which use overscanned mode in ST Low (I don't
remember the name of the program which manage this kind of file).

Most of the painting program on ST use exclusively the three modes
(like DEGAS ELITE PI1/PC1, PI2/PC2, PI3/PC3)
or only one of them (NEOCHROME .NEO)

Some use special format like SPECTRUM 512 (.SPU, .SPC)
which work in ST-LOW using only 199 lines but 512 Colors in the same
time (using a special technic consisting on changing 3 times the color
palette per line)

I hope I answered your need.

You can use the converter Five To Five which allow people to convert
sounds from different format to different others.

You can find it on : ftp.cnam.fr/pub/Atari/Music/525_v211.lzh

What is the difference between the two packages WWW117 and WWW130.

I think WWW130 is the newest version.

But why I have read that the WWW117 package will once be ready?

Does anybody know something about this?

No.
Take a look at the trap dispatcher for trap #1 (GEMDOS) that is installed
by MiNT. This dispatcher slows the system down.
No AES will be able to speed this up.
As MiNT uses the ROMs for disk access it will never be faster than
TOS (so far as you use DOS file systems).

Check the References: field . It seems you have picked up a previous news
article as if you were replying to it , was that deliberate or something
to be corrected ??

I also find posting to demon.test to be the best way of beta testing
news stuff . Mainly because you get the full header posted back at you
as well as a gauranteed reply from currently it appears only 2 hosts but
usually a lot more ..

I dont know if this feature is included in O2/Ice but you might want to suggest
it because I find it really Xcellent feature of the reader I am using (knews)
and that is a graphical thread tree view. this means even though a few
conversations can take place on a subject tree you can view and click through
the messages in a more orderly way.

yep text editors are okay and i dare say WP may just fit into 640K
(what version though) ..

> I also use Norton Comander so I do not have to type all those
> DOS commands. Some one needs to create a module or something

Norton works yes , lots of fun to be had using msd and si on it.

I think I got a System rating of 2.1 on my Falcon. which makese it
286 ish.

> to make it use the DSP. The program is very solid and I am gals
> to have it.

I was equally impressed with the stability , it is solid as a rock i
agree , but the chances of getting dsp useage are NIL , Atari never
paid INSIGNIA which is why I think they dropped it . That is a shame
becuse they have made great work on the eMac soft PC pro and Soft
Windows . Not that I think they would have taken it that far but
it is very much a v1 release and it could have been amazing by v2 !

> I can print and use the mouse under SoftPC but have not figure
> out the Modem ports yet. If I do I can also use DOSFAX and COMIT
> Both are very Recent IBM programs.

yep the basics are all there , I would have liked to see the finished
article , I beleive it would have wowed !

> I agree it would be impractical to try to play games on SoftPC,
> but is was not crested for that anyway. It is a great program and

Well as testimont perhaps to how good it is I HAVE run games on it ,
a load of old games from the days of 286's and most worked !!

: standard graphics resolution. The FAQ also does not explain "overscanned" and
: "underscanned" modes. I assume this is how Atari achieves 640x200x4 resolution?

: Somebody care to enlighten me? Thanks much.

ST-Low: 320x200x16
ST-Med: 640x200x4
ST-Hi : 640x400x2 (Monochrome)

Overscanning is achieved in one of two ways. One is a hardware hack which
removes the borders. The other is through software, which removes the
top, bottom and/or side borders. Removing all four borders is processor
intensive, however, so there aren't many CPU cycles left over for other
things. Overscanning achieves somewhere in the neighbourhood or 360x240
or so, with all four borders removed. It's usually necessary to scrunch
the monitor's horizontal screen size to see a fully overscanned screen.

Dan Dotson (dand1@azstarnet.com) wrote:
: So I wound up, by a quirk, with this neat-looking Atari system but I have a few
: problems. This looks like the place for answers.
: The system consists of a console which says 520 ST on the top. On the bottom, it
: says STm. The monitor is a SC1224 and the disk drive is a 3.5 floppy, SF354.
: There is also a mouse, of course
: Problems/questions:
: 1. I have no discs. Do I need a system disc, or what? If so, where might I find
: one?

There's no 'system' disk, per se; Atari's OS is all in ROM. It does come
with the "USA Language Disk" which contains mostly useless stuff; the most
you may want off of it is the control panel, which allows you to set
default desktop colours, key click/repeat rates, mouse double-click rates
and so on. There are better control panels available.

: 2. Is this sytem worth working with at all? It does come up with a screen with
: drive icons A and B and a little menu bar at the top. I can change screen
: resolution,etc. The mouse works,etc so I believe it is operational- just wonder
: if it's worth much effort to get into full swing. If it is, where might I get
: the manuals, etc to accomplish something?

If it has not been uypgraded, then it is a stock machine with 512k of RAM,
which for the most part, is sort of useless. A lot of the decent programs
require, or in any event run better with a megabyte of memory or more.
(It is expandable to 4, or with additional hardware, such as tthe Marpet
XtraRAM Deluxe, to 8 megabytes) Unfortunately, it uses DRAMS, so
upgrading will be neither cheap nor easy. There are hardware boards
available thaty allow you to use SIMMs, however.
As for whether it's worth looking into -- certainly. Of course, that
depends on what you want to do with it. For MIDI, nothing's better. For
graphics -- well, it's a little anemic in that department, its most
colourful resolution being 320x200x16 colours and its highest res being
640x480 in monochrome (which requires a monochrome monitor or multisync
with adapter) For sound it's pretty decent; you can play MODs on it at
around 17KHz with ProTracker. (An STE is much better in the sound
department, however -- and foer that matter, the graphics department, too,
having 4096 colours rather tthan a palette of 512 on the ST)

Hope this helps.

: That's enough for now. I appreciate whatever counsel any of you experienced
: Atari people might have for me.
: Thanks,
: Dan Dotson

s> This is an extract from STR #1213, the most recent to my knowledge.

.at the time of posting, yes.

s> I didn't bother to read the whole thing - it only contains a small

.well you should. The rest of the magazine is NOT PC specific.. it is computer-communications related and contains very interesting articles every week.

s> reporting Atari's sell-off of some warehouse stock but neglecting to
s> report what was being sold and what the prices were.

Are you sure that the press release that was printed in STR was actually the same one that was posted on c.s.a.s?? It looked different IMHO... not truncated. :|

s> provisions of the US Copyright law); it consists primarily of
s> something that verges closely on slander. It can only be termed

.so what!? It's a laugh! :)

s> humourous by those who have a very sadistic sense of humour, and a
s> deep-seated hatred for all things Atari:

Oh please!!! Have you absolutely no sense of humour at all!?? I have been an Atari fanatic for ten years and have closely followed the development of the ST/E/Falcon and Jaguar. All of which had potential mass appeal that was simply wasted by Atari's awful marketing strategy. Also, look at the abysmal design errors and underused features on the ST.... the non standard hard drive port, the positioning of the joystick ports and the analogue joystick ports are just a few examples.

The article which you are complaining about merely highlights the same problems with the Jaguar.... and proves that Atari never learnt from their mistakes. IMHO the article was probably written by a dedicated Atari fan who, like myself, believes that if you can't laugh at yourself the what can you laugh at!?

>> s> this time?) (R) Controller with a ten-key pad and other special
>> s> features (secret key sequence brings up image of Sam Tramiel
>> s> laughing at you)."

ROTFL!! This is one of the funniest things I have read in a /long/ time... you really should lighten up mate, there was nothing wrong with this article at all! :)

s> For those of you who have never read ST Report, you have just had a
s> taste of the sort of "impartial reporting" that is typical of ST

Bollocks!!! This is absolute crap!! ST Report consists purely of press releases, short news bulletins, PC Software reviews and hardware guides and two small editorials.... one from Ralf and one from Dana. These editorials are the only places in the magazine where a personal view is expressed, and the only place where any "impartial reporting" could possibly have the chance to take place. Due to it being an editorial you should KNOW that it is simply the personal opinion of one person and not something to be taken as the view of the whole magazine team.

Personally I think both editorals make very enteraining reading...

s> Rpeort and, indeed, any publication controlled by Ralph Mariano,
s> world-
s> famous Atari-hater and accused defrauder of many prospective Atari
s> purchasers. I say "accused" because the Florida State Attorney
s> General has refused to prosecute; the vast majority of Ralphie's
s> accusers are Europeans, and we all know how Europeans fare in
s> Florida.

Is this your reason for slagging off the whole magazine!!??? Ralf has nothing to do with the Atari side of STR.... that is all run by Dana Jacobson, so don't let your personal anger toward Ralf cloud your judgement of what is an excellent publication.

Unless you can show me a better on-line magazine than ST Report, I will simply hold the belief that you are a sad person who lets personal disputes with one person become a problem for many.

s> Anyhow, this is the reason I do not ordinarily download or read STR,
s> nor do I allow it to be uploaded to STarship BBS. If I want slander,
s> I can go read the Amiga groups. <G> If I want news, there are

It was a small, one off joke article!!!!!!!?? I can't beleive you are so totally lacking an /any/ sense of humour!

s> ST Report: Your Source for All The Lies That Fit In Print

.. on what evidence!!!!?? Show me a lie that STR has printed???

What you need to do is change the flavour of the mail packets from Hold
to Crash. I've never used IOS (I used ACS and now use Jetmail) but I'd
guess there's a way to call it to convert any packets or, if necessary,
to create a dummy crashmail packet to trigger Bink. You'll need to have
the crashmail flag set in BINKLEY.EVT, too, or Bink will ignore them
anyway.

Regards,
Keith

727. Blowup FX Board

Newsgroup: comp.sys.atari.st
Date: 1996-04-11 00:00:00 UTC
From: arvid.johnson@quest-net.com
Message-ID: <00001EBE000001FF@quest-net.com>
Source record: 147299

Hi everyone,
I've been reading this group for about a month now and decided
it was time for me to throw in my 2 cents (actually some questions).
I do enjoy the discussions here and whenever I can I will venture to
offer answers to questions that I think I know something about.

Today, however, I'm asking about the relatively new Blowup FX
board for the Falcon. I'd like to purchase one, I think, but I
have a few questions.

I have an Atari Falcon030, 4meg Ram, 80 meg HD int., 50 meg HD
ext., 2x CD-ROM, and 14400 Fax Modem. I use ScreenBlaster II for
resolution enhancement with a 14" CTX SVGA Multiscan Monitor.

1) I have 4 1-Meg, 30-pin, SIMMS

2 are Hyundai module #HYM591000AM-70 with 3 chips, 2
#HY514400J-70 and 1 #HY531000J-70

the other 2 are TI module #GT3009 with 9 chips
#TMS44100DJ-70

These SIMMS were extracted from an Intel Above-Board memory
expansion card in an IBM PS2-50. Can they be used with the
Blow-Up FX?

2) How extensive / intensive is the installation process for
the board?

3) Is the board compatible with ScreenBlaster II?

4) Are there any heat problems with the CPU or DSP chips when
the accelerator is enabled?

I would be grateful for answers to these questions and any other
information anyone can send me that would help me make a decision
about this Board.

Thanx,

... arvid.johnson@quest-net.com flying the falcon

>
> "I'm not only an INTJ, I'm smug about it!"James,

Here's some info on Atari ST Graphics Modes

X Y Colors Bit-planes

ST Low 320 200 16 4 32,000 bytes

ST Med 640 200 4 2 32,000 bytes

ST High 640 400 2 1 32,000 bytes

TT Low 320 200 256 8 153,600 bytes

TT Med 640 480 16 4 153,600 bytes

TT High 1280 960 2 1 153,600 bytes

I don't think The ST or the TT use any king of overscan, but I'm not sure.

I have a text file that lists all the known Atari Graphics file formats.

Hope this helps,

Jim Fouch

Since you are in the USA, try Best Electronics. They sell a set of keyboard enhancement springs (or mushrooms) and I can vouch for the fact that they work, extremely well too, because Best were at a show in the UK a couple of years ago and had a demo keyboard set up. Some keys were fitted with the upgrade and some were not. The difference was notable.

733. Re: TT030 & Spectre GCR 3.0

Newsgroup: comp.sys.atari.st
Date: 1996-04-11 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <4ki3rs$m2n@madeline.INS.CWRU.Edu>
Source record: 147404

Yes it seems to. I just got a tt030 with a VGA screen, and while
I have not yet checked it out thoroly, it does seem to work.
I don't know about the 19"screen. But if it properly shows
a st High screen, which spectre uses, it will. With my VGA,
it switches automagically into the right rez.
There may be a problem with the floppies, or with
reading TT ram, however. There is a faq sheet released a while
ago by Gadgets, that describes a small? mod to the GCR cartridge
itself. It doesn't say what it does, but it is a 74LS04 hex inverter
stuck in series with one of the lines. This either sharpens the
gate signal, or adds a 300ns delay to it. At any rate, the faq says
that cures the problems. A colleague of mine, who uses Spectre
regularly, says that it made his work.
I am not yet sure about mine, yet. I have only tested
it briefly, and it read commercial disks ok. It had some problems
with some I had made earlier on a 1040STf/16MHZ. I am going to make
the mod tomorrow, or fri. It seems, a 1.44M disk also has problems
that the fix cures, but one MUST read a DD disk before booting,
to set the clock, I guess.

[Article crossposted from comp.sys.atari.st.tech]
[Author was Bradley Maurer]
[Posted on Fri, 12 Apr 1996 01:51:13 GMT]

A quick question for all you knowledgeble tech gurus out there.

I'll be getting a 486 in the next few weeks, and have been straining the old brain to think of things to do with it. I've been hard pressed to come up with a whole lot, because, as we all know an Atari can do anything with the proper encouragement! ;)
What i'd like to be able to do is use the PC's tape drive to back up my Mega's HD. Obviously, this will involve transferring large amounts of data from one machine to the other even though I only have a 40m HD in the mega.
What I envision doing is dumping the contents of the mega's HD to the zeos' and then backing the data up on the tape drive. The process would have to be reversed to restore the data.
Any ideas on how to this? I understand that any solution will probally be pretty time intensive. However, I expect that in most cases I probally won't have to restore the entire drive, only a partition at the most--probally only a file or two hopefully.
Maybe there's away to network the two machines? Or will this have to be done via (null?) modem. Hopefully, it won't involve the obvious use of floppies!
BTW my mega's HD is a Connor 40M scsi and the zeos has a 1G and a 540M ide.
Thanks in advance!

735. HD's

Newsgroup: comp.sys.atari.st
Date: 1996-04-12 00:00:00 UTC
From: gregor@shelly.goldengate.net
Message-ID: <4b7cc$14ef.394@goldengate>
Source record: 147120
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

As long as I'm the subject of HD's, another question....
I'm interested in adding another HD to my mega. Currently, I have an internal Connor 40M and am wondering what would be involved in adding a second (external?) HD. Or for that fact replacing the internal 40M with a larger drive and still adding a second.
I have to admit ignorance here. I bought the Mega second hand and the HD was already installed and so I have no documentation for it. I understand that certain jumpers or DIP switches might have to be reconfigged. Also, I have to wonder if I might need a different driver for a different type of drive etc.
All I know at this point is that the Connor boots up at power up. Is there a utility in the auto folder that I've overlooked that causes this and will it have to be replaced?
Any insights would be helpful. The only thing that I'm pseudo sure of is that I'll probally need a external SCSI drive.
Also, I'm getting a 486 in a couple of weeks that has 540M IDE HD that I'll be immediately upgrading to a 1G, any hope of using this? it's, of course and internal drive and I'll probally have to purchase a case and power supply etc to use it with the Mega. Is this feasible or would I be better off selling it and buying a SCSI?
I just got a bump up at work...a fool and his money are soon parted...;)

>Well the new stik is great, recognizes the other serial ports a little
>better. My question now is, can I use it at speeds above 19200?

Yes, just change the baud rate in the setup program or the BAUD_RATE
variable directly.

>What's the point of WWW'ing without a 28.8k modem?

19200 is ok, slower speeds are fine if you disable graphics until you
want / need to see them.

>And what's the point of a 28.8 if STiK only goes to 19200??

The default was put at 19200 for compatibility throughout the entire
Atari range as they all can handle this speed.

>
> Any ideas???

Look in the beta_000.txt file, there is a description of an (partially
unsolved) problem which sounds similar to yours.

With MagiC, I can run stiktsr and stik.acc from the desktop - the
problem goes away. Assuming you have already tried the usual solutions
of disabling all the rest of the auto folder programs and accessories
then all I can suggest is the following ...

move stiktsr.prg out of the autofolder, disable stik.acc and enable
the Chameleon. Run stiktsr from the desktop (hopefully it will install
ok) then use the Chameleon to load stik.acc

I've no idea if this will work but it's all I can think of.

Worse still, I have a TOS 1.0 machine but there is no disk drive in
it. I might be persuaded to put one in it if you get *really* stuck.

It should be able to. Two possibilities I can think of ...

Was the PC drive Doubled Sided Double Density? If it is not then this
could be the problem.

Your original drive was slowly getting out of alignment. This would be
bad news indeed because in effect, it would be making up its own disk
format which only it could read.

>My Amiga also cant read the pc drive formated discs.

My gut feeling is you've installed a high density drive. It's only a
guess though!

>given the fact that IBM compatibles don't have built-in MIDI ports.

True, PCs don't have "built-in" MIDI ports in that the bare chassis doesn't have them built onto the motherboard, but "most" PCs actually DO have "built-in" MIDI ports since many soundcards include them.

In particular, SoundBlaster products from Creative Labs have MIDI ports on the sound card, with the connections brought out through the built-in DB-15 joystick connector. You need a cable with active isolation electronics to convert from the TTL signals of the card to the current-loop signals of the external MIDI device. All you do is plug it into the joystick port and plug your MIDI devices into it.

Since most PCs come with sound cards these days, it's reasonable to say that "most" PCs DO have built-in MIDI ports.

Naturally you'd have to check out your own situation to be sure the card you have, or are interested in buying, has a similar connector.

> hard drive Mechanism that you choose!

Check. It sounds a bit obvious now. <g>

> Now bus arbitration is something you WILL have to watch out for!

Check. No bus arbitration. [Since I'm only buying one drive, it will
have to be the boot device, so that takes care of that...]

> I will recommend a call to Toad Computers [...]

To be honest, that's why I asked here. Toad's prices are rather immodest.

Hokay... guess it's time to start hunting down small SCSI things which
don't require arbitration. [Hmmm, that sounds like something a baseball
owner would say.]

Thanx Tom...

741. LOTS of Atari STuff for sale

Newsgroup: comp.sys.atari.st
Date: 1996-04-12 00:00:00 UTC
From: smselick@ios.com
Message-ID: <4kko5k$g8@news.ios.com>
Source record: 147126
Cross-posted to: nj.market.computers,comp.sys.atari.st

All prices include shipping within the continental US. Buyers local to northern NJ may pick up in Newark, Clifton, or Fort Lee/Palisades Park. All equipment is in working order, except where noted. All sales are final.

Contact Steven Selick at 201-284-3308 days, 201-484-5029 evenings
E-mail sselick@itt.com for faster response.

Atari 1040STe with 4 meg ram and Adspeed STe 16mhz/8mhz switchable processor. Comes with mouse and power cable $225

Atari 1040STf - basic 1 meg machine. Has not been used in years. Worked fine though. Includes uninstalled PCDITTO 2 board. $50

Two SM 124 monochrome monitors $35 each. Both work fine.
One SC-1224 color monitor $40 - works fine.

SCSI hard drive/CD/Tape drive system - 500+ meg scsi hard drive, 1x internal caddy CD-rom drive, and 60 meg scsi tape drive all in a PC desktop case with a built in power supply. This unit also comes with an ICD Link 2 ST adaptor. All works great, and has proven itself as a complete system. Includes many registered software packages - Gribnif Neodesk 4, Geneva, Stalker/Steno, Extenods (for the cd-rom drive), Diamond Back (for the tape drive). All this for $225

Scsi dual-mfm hard drive setup - 2 159 meg mfm hard drives each in their own case with built in power supplies. These drives use an Adaptek 4000 mfm controller and a Supra host adaptor. Ready to use. Clock may require a new battery. $125

Scsi system similar to above but both drives are in a single wooden case (handmade). Not pretty, but functional. $125

Spectre GCR $75 (System 3.0)
Spectre 128 $45 (System 3.0)

External floppy drive ds/dd $20
Walnut Creek Atari CD-rom $10

Synchro Express hardware disk copier (works great with external floppy!) $10

External 14.4 Practical Peripherals modem $50 works great!

That's it!
-Steve

742. Re: Need poop on Atari ST graphics modes

Newsgroup: comp.sys.atari.st
Date: 1996-04-12 00:00:00 UTC
From: BobR <76702.1466@CompuServe.COM>

Source record: 147127
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Just in case it wasn't fully clear from the other replies... the Atari ST has only *3* graphics modes:Low, Medium and High, with the pixel resolutions given in the other replies.

The other "modes" are hardware or software hacks to achieve non-standard pseudo-resolutions.

As was mentioned, not all STs can use all of the non-standard resolutions.

For complete compatibility, you have to stick with the standard three.

> ide.
> Thanks in advance!

I've done something similar, but in reverse (PC->Atari->Tape).

Get a hold of Ghostscript, which will allow an atari to connect to a PC via the serial port. The atari will then be able to 'see' the PC's drives.

I doubt you will be able to 'see' the tape drive, but you will be able to save from Atari HD to PC HD & then save to tape.

Ghostscript is free & should be on umich.

The speed will be 19200, so transferring this way might take up to 6 hours for a full 40 mbyte. If your disk is not full, then it will be quicker.

If you modify the serial port to get 38400 baud, this will improve things.

If you use MiNT, the transfers can take place in the background, but will take even longer.

Since you don't have to be there, you could leave it run overnight.

:
: the other 2 are TI module #GT3009 with 9 chips
: #TMS44100DJ-70
:
: These SIMMS were extracted from an Intel Above-Board memory
: expansion card in an IBM PS2-50. Can they be used with the
: Blow-Up FX?

Yes.

: 2) How extensive / intensive is the installation process for
: the board?

A friend of mine who actually owns one of these cards, says that the
installation process is very similar to the Speed-res card. I've installed
a speed-res card in my Falcon, and it was quite easy. It needs a lot of
soldering, but it's not difficult, just time-consuming.

: 3) Is the board compatible with ScreenBlaster II?

Well, the FX-card has it's own graphics-enhancer, BlowUP. The BlowUP-software
is quite good, but perhaps not up to ScreenBlaster-standards. You don't need
to install the BlowUP-hardware though, that way you can use ScreenBlaster.

: 4) Are there any heat problems with the CPU or DSP chips when
: the accelerator is enabled?

Not that I know of. I've accelerated my Falcon to 36MHz CPU and 50MHz DSP, and
there was no heat problems. But I glued on a couple of heat-sinks just to be
safe.

I can really recommend the FX-card. The fast-ram makes quite a difference, just
take a look at Bad Mood 2.06 on a FX'd Falcon! Almost all software (Including
MiNT, X, AES 4.1, MagiC, NVDI...) runs very well in fast-ram, speeding up the
Falcon quite a lot!

>resolution. The FAQ also does not explain "overscanned" and
>"underscanned" modes. I assume this is how Atari achieves 640x200x4
>resolution?

The standard ST and STE modes are 320x200 4 planes, 640x200 2 planes,
and 640x400 1 plane. The ST has a 512 colour palette, the STE 4096.

If it's just the hardware modes you are after then that's it, but if
you want to know what resolutions the machine can do then the answer
is any because the OS is resolution independant. Software solutions
either slow the machine down or require you to scroll round a larger
virtual screen. Hardware solutions are obviously the best and depend
on the spec of the card - which are damned expensive because they are
hard to fit - shame really. As you have probably guessed by now,
overscan can be done by software or hardware, or both.

I can't remember if this is single or double sided. Someone else is
bound to know.

>There is also a mouse, of course
>Problems/questions:

>1. I have no discs. Do I need a system disc, or what? If so, where
>might I find one?

No. There is one but like me, you'd take one look at it then go out
and buy some decent languages and utilities. There's plenty of good
shareware stuff these days. Although there are disks that come with
the system, they are not system disks in the PC sense. Your operating
system is completely in rom.

>2. Is this sytem worth working with at all?

Yes, they are still worth using because you don't need to be upgrading
every six months or so, more like years. It comes down to what you
have actually got in there and what you want to spend.

>It does come up with a screen with drive icons A and B and a little
>menu bar at the top. I can change screen resolution,etc. The mouse
>works,etc so I believe it is operational- just wonder if it's worth
>much effort to get into full swing.

It's working.

Find out ...

a) If it has a single sided disk drive. Nearly all ST's have
double sided ones and you would have to upgrade this. Most of
the old PC DD drives will fit. Find out by stuffing a DD disk
in, left click once on the drive a: icon then on the menu bar
"Format" option. Follow the prompts. Try single sided first to
make sure the drive is responding, then double sided to see if
it really is.

b) How much memory it has. 1Mb will run most stuff, 520K is
useless. Don't go by the badge, a lot have been upgraded. If
you need to upgrade, get one that allows SIMMS to be plugged
in. The system won't tell you, you'll have to get a program to
do it.

c) The operating system version. Not so important unless you want
to add a hard disk.

>If it is, where might I get the manuals, etc to accomplish something?

The manual is about as useful as the system disk. Quick quide ...

Single click on something to select it (check for menu items becoming
enabled). Double click to execute/activate it (or single click then
use the menu bar "open" option). The right button is not used as
standard.

>That's enough for now. I appreciate whatever counsel any of you
>experienced Atari people might have for me.

Get hold of a few programs and try them before you make the final
decision. Provided it has a 720K drive then you can format a disk to
that size on a PC (80 track, double sided, 9 sectors per track) and
the PC and ST will be able to read and write to them - that way you
can get stuff on it to find out.

This would also work for a single sided drive but where on earth would
you find a PC these days that can still do it?

Also, try to use a proper DD floppy, high density ones can be a pain.

Gem is resolution independant so I assume you mean the software has to
be also be capable of running in one of the three standard modes?
(sorry to be pedantic but I missed the original question). :-)

No I didn't, I've found it (after the replies *again*) ...

He asked about graphics modes in general, not hardware modes, so it
seems best to let him choose if he wants to be bothered with the
information?

It seems so. AFAIK the newer MagicMac version introduced preemptive
multitasking on the MAC, maybe this is the problem. Anyway, NVDI works
great with MagicMac,

If these were anything like the clocks on the supra host adapters, then
there might be a small variable capacitor to allow fine tuning.

If there is not, how do these clocks measure time, ie. crystal, ceramic
resonator or just plain r/c ?

I'm using 2 different makes of SIMMs in paris but I'm not mixing
3 chip and 9 chip SIMMs. Don't know how that will work.

>
> 2) How extensive / intensive is the installation process for
> the board?
>
I installed my own but unless you're very good with a soldering
iron and the use of 28/30 ga wire, don't. Especially if like I had to do,
install the the full Atari 'Clock Fix'. It wasn't in my FALCON. You DO have
to cut a couple of foils and solder to them, the DSP speed up and something
else.

>
> 3) Is the board compatible with ScreenBlaster II
>
Yes. I'm using Screen Blaster II without any problems. I did NOT
install the "BlowUp" screen enhancer part of the FX board.

> 4) Are there any heat problems with the CPU or DSP chips when
> the accelerator is enabled?
>
The BlowUp FX comes with a heat sink for the CPU chip. The
DSP, well mine works most of the time but for some reason, won't work for

decoding JPEG's. Haven't really looked into this.

>
> I would be grateful for answers to these questions and any other
> information anyone can send me that would help me make a decision
> about this Board.
>
I've got mine to boot and run at 40 MHz and that's where I leave it.
I do have a problem with the FPU not working, mainly because it is only a
20MHz version. Again, haven't looked very hard into this problem yet.
I have the same basic system as you except I'm running an external
540Meg SCSI but I've had no problems with HD access. There was a 1 wire
add that was not in the manual but in the .DOC's on the floppy. Had to deal
with Memory Writes, a speed increase. When I tried adding this wire, I
couldn't make my FALCON run in any of the High Speed modes. Had to
remove it.
Hope this helps you: Rich Mier

DE-uuencode them? I just issue the 'get' and then do the extract
(LZH,ZIP) directly. I don't believe they are uuencoded to begin with.
(but I've been wrong before...)

Please try the new version of CAB (V1.2). If you need more free memory (on a 1 MB machine) you could remove the JPEG module.

Actually, this is not a good idea. At least for those who do not feel comfortable soldering, as well as the fact that such modification does not result in a proper SIMM contact/connector edge.

There IS an adapter module that will convert SIPPs to SIMMs. I know because I bought some. However, I am in the process of moving and a lot of my material is boxed up, so I doubt I can supply you the vendor information at the moment. Perhaps next week I will try to dig it out.

I have a like new, unmodified Falcon030 4/65 unit for sale. This unit
has seen very little use (none in the past 6 months). Truly Perfect
condition with original box, manuals, VGA adapter, pre-installed software
(AtariWorks and other goodies), and a grab-bag of 50 or so DSDD floppies.
Only $495 *including* shipping (USA only) and I will guarantee the unit.

>For complete compatibility, you have to stick with the standard three.
<SLAP>

One must distinguish between applications and games (not unlike PC's).

Programs that run under the GUI and use it's extensions should be able
to run in any resolution. Some programs like autocad specify a certain
mode. Besides such exceptions, GEM programs should be hardware
independent. (See GEMulator,STonX & MagiC)

TOS programs (games) are very hardware dependent. With these it is best
to stick with the most standard configuration possible.

Depends upon what you like to run...

So? Where in the bios are the calls to access the midi port?
When you take the PC out of the box, where are you going to
plug the midi cable into? How are those ports and their timing
integrated into the rest of the system & the bus?

Built in on the ST and 'built in' on the PC aren't the same thing
by any stretch of the imagination.

>hellman@teleport.com Internet Public Access User Hillsboro, Oregon USA

Yes, I installed them on two old 1040STs, whose keyboards I found
strangely flat and unresponsive. In my opinion, they were useful. The
keys feel like they are pushing back at you instead of flopping dead.
No, they are not as good as the Mega keboards or IBM-type keyboards, but
they were an improvement for me. I make fewer typing errors and I type
faster. I did not install them on the function keys, caps locks, etc
--just those keys you use for typing.

I don't know if they are still available. They are not hard
to install, but it takes time prying off the keys one by one and
pushing them back. Tip -- be VERY systematic or you will forget
which keys you upgraded and which not.
Try Toad computers. They have everything.

PM> Is there any way to convert Truetype fonts into Calamus SL format?
PM> Either PD or commercial.
PM>
Not that I know of. But most PD TrueTYpe fonts were available as PostScript
Type 1 fonts, and they are the kind of fonts you can convert into CFN!
The FaST Club in Nottingham will provide you with PFB2CFN [along with
Fonty]:

stclub@cix.compulink.co.uk

Costs £11.95 [postage not included]

Greetings, Rein

P.S. Forget about editing Speedo fonts. Why should you want to? 564
characters are enclosed and can be used provided you have made a mapping
file to let Speedo characters correspond to your choice ASCII positions.
I can write in Polish, Turkish, Hungarian, Czech should I want to! All
available in Speedo fonts. Not a single TrueType can match that.

775. Help with HSModa6?

Newsgroup: comp.sys.atari.st
Date: 1996-04-12 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <4kmaod$8in@madeline.INS.CWRU.Edu>
Source record: 147310

Help!
I have gotten hsmoda6 from Umich and have problems setting it up
in my TT (4+4) and/or on my 1040STf (16 MHz,4MB) to do anything higher than
19.2. Both computers are not modified in the modem hdwe.
Setter.prg (gem) does not want to run correctly. It comes up with
a set of long strings that extend off to the right. The text has
"cr"s and pictures of a bell embedded in the text which I assume are meant
to be CR/LF which don't get translated right.
Is there a version of setter.prg (gem) somewhere that might
transfer better (without the bugs I seem to have) on the internet?
Setter.ttp has English only in the "enter j/n/y/n" dialog,
NOT in what the line is supposed to do. I studied German years ago, but
it it was too out of date and rusty to follow the script.
Once I get it set up, (I assume I'll get it to work someday)
Do I need to run from modem2? What happens to my older programs
like Uniterm that only understand Modem1, with baud rates from
19.2 down to 300??? I can't use connect, because it doesn't have some of the
features I need to talk to my VAX, which uses true VT220, and Tek 4014,
and allows me to set up a complex script for dialing in, and to change
meanings of keys for my VAX, and gives me a 50 line mode??
Do I have to switch cables every time I want to use one program
or another??
For a program like STiK, do I tell it to use e.g. 110 if I
really want 38.4?
I now have a 14.4 modem. What is the highest speed I can use
practically with the TT and with the 1040?
Do I load all three, mfp, mfp_tt, and scc in the auto for the TT
after fixing?
What do I do with the modem.cpx? does it change?

Are there any Atari brand 14" color monitors that are at least .28mm or better and do the TT030 VGA resolution of 640 x 480 x 16 color (TT medium) at non-interlaced mode. I dont wont flicker and want a non interlaced atari brand.

What are these models and can they work.

SC1435 or ?????

Mr. Maddog (mrmaddog@prolog.net) wrote:

: How much overhead is just removing the top and bottom boarders?

The top and bottom borders don't take much time. It's the side borders
that really eat processor time because they use the HBL, not the VBL; the
HBL is a 200Hz interrupt.

: I have a source code for this demo that can do this in 50Hz mode and
: I want to put this in a game I'm writting so it'll automatically do
: overscan on European machines. I appears that I have to keep
: accessing the routine with each vbl. The game is in STOS, but I can
: use assembly rountines with no problem. Is there anyone who can tell
: me more about it? Thanx

You could modify the overscan routine to run itself, rather than run every
time it's accessed. That would produce more stable results, and would
also be easier to use from within STOS. I don't program in STOS so I
don't know what's involved in accessing assembler routines from STOS
programs, but if it's anything like GFA then it should be a doodle.

> You have to use modem2 instead of modem1 to get higher baud rates.

Modem 1 and Serial 1 are limited to 19200, as they are both controlled by
an MFP chip (Motorola 68901)

Modem 2 and Serial 2 are capable of higher speeds as they are controlled
by a different serial controller (NCR 5301).

Also, your _software_ should be aware of the extra capability of a TT.
Otherwise you'll be limited to the lower speeds.

So. You are looking for atari st _warez_, now are you ?
Well, how can I put this nicely... maybe... *FUCK OFF !!!*
That nice enough for 'ya ?
Fuck off you jerk! This guy is moron!
Which one? ;-)
All of them for using such language.
However, assuming that the meaning of "warez" has not changed in the last
ten minutes (from what I am led to believe, it's a sort-of slang for
"pirated software"), then the emotion expressed was correct, the language
was not. (Sorry to be such a kill-joy, but...)

And to all those seeking/storing/selling warez,

"GO SWALLOW A LIVE HAND GRENADE".
Ah. So where does this sentence differ from my initial reply then ?

1) It doesn't use one of the seven "banned" words under the US's CDA
(Communications Decency Act) censorship law, so my phrasing will make it
past any CDA-aware filter.

2) The end result of doing what I suggested leads to a decrease in the
number of persons looking for, or actively trading "warez". Unlike yours
which just spreads them out differently - a redeployment, rather than a
reduction.

3) Mine's longer, and written in ALL CAPS.

However, that said, we both share a dislike for the warez doodz.

>
> Regards,
>

Have a look at umich, there are some DIY ram upgrade files.

I know the 520STFM had space for the extra 512 Kbyte of ram (I know cos I
used to have one) but I believe that the original 520ST did not.

It is not true to say that all ST motherboards are the same.

I know somebody who put in an extra 512K by piggy-backing the new ram
chips on top of the old ones. It took some skillful soldering, but it
worked.

It was not reliable however.

To get 4 Mbyte, you would need 2 banks of 16x1 Mbyte chips (thats 32 in total).
Thats a lot of chips for a small space. To cram that into a 520STFM, you
would need to remove the original 256Kx1 chips & replace them with 1Mx1
chips.

Unfortunatly, they do not have the same pinouts.

Good luck

Hi Sid!

Thanks for the advice. The old man has managed to buy himself a new 600c
for very cheap locally, which although not Atari-wonderful, should enable
him to do all that he wants, and keep the girls happy with picture
printing. I've pointed them towards a few programs that should enable them
to get something decent out of the printer. I presume that most Deskjet
500 drivers will look after the text side of things anyway?

Speak to you soon!

I sort of considered the Epson stylus, but was a bit worried about printer driver support. The main use will be for WP from Write On, and as it is an old programme, has to rely on Deskjet drivers.

The old man has managed to locate a new 600c locally at a throwaway price, and I think he will opt for this. AW in AW gave this printer a good review, so I think it should suffice, even though the ST can't make use of many of its features :-(

Thanks for the advice

Hi,
I have had GFA-Assembler V. 1.5 laying around for a few years now.

It is an Excellent 68000 Assembly language system, the thing is I was
not able to afford the documentation to it when I had gotten it (it had
come through an issue of Atari ST User).

Would someone happen to have the Documentation to this system?

Thanks,

804. Help with DAVektor and TrueImage

Newsgroup: comp.sys.atari.st
Date: 1996-04-12 00:00:00 UTC
From: smiller@farad.elee.calpoly.edu
Message-ID: <4kka1u$eoc@isnews.csc.calpoly.edu>
Source record: 147339

Hi, I was wondering if anyone could tell me the latest versions of the above mentioned pieces of software...

I recently bought(at an incredible deal I might add) both pieces of software with everything intact and I currently have:

DA Vektor 1.04 (11.02.93)
True Image 1.70 (030) (1993)

Are there more current versions?
I have run into some problems with both pieces of software...

#1 DA Vektor takes ALL of the memory in my TT (I have 18 megs) and it will not allow the printing of the most basic jobs, it also burps when doing 3D extrusions on somewhat complex vec(K)tor graphics...

#2 True Image does not output TIFF files that are useable in the newest version of Calamus and in Studio Photo...

Is there a photo-image program out there that actually can come close to photoshop?!?

Please let me know soon :)

805. Write Verify ???

Newsgroup: comp.sys.atari.st
Date: 1996-04-12 00:00:00 UTC
From: phil4@phil4.demon.co.uk
Message-ID: <829393832_OASIS_@phil4.demon.co.uk>
Source record: 147340

Having just read a small text file about write verify I thought it might be a good idea to ask for your advice.....

The file suggested that having write verify on was a complete waste of time.

I thought about this and can think of one instance when this is mostly correct and when its probably incorrect.

The first is with using hard-drives, which seem (in my experience) to run into bad sectors quite infrequently (I've had none in 5 years of harddisk life), and so checking after every file write is really quite pointless for 99.999999% of the time.

The second instance is when writing to floppy disks, which in my experience are ALWAYS getting bad sectors.... So when writing to these I usually like to know that there is a problem with the disk when I copy a file to it, so when I give the disk to my friend, he doesn't bring it back in a day or two saying some vital file had a bad sector in it.

So what are your views, is it a complete waste of time, is it good in some circumstances.... does it do anything at all ??? Is there anyway of selecting which drives have write verify on and which don't ???

Thanks

806. MOD file players

Newsgroup: comp.sys.atari.st
Date: 1996-04-12 00:00:00 UTC
From: phil4@phil4.demon.co.uk
Message-ID: <829420896_OASIS_@phil4.demon.co.uk>
Source record: 147341

This is really a plea to those people who write and update mod fileplayers....

Hows about adding a 'mono' option to STe MOD players ???

A resonable number of falcon mod players I have seen have this option for people using headphones, the starnge thing is that the people writing MOD players on STe don't think anybody uses headphones !!!

I hear you say why bother ?! Well have you tried listening to a MOD file in stereo with headphones ??? it sounds cr*p because unlike a normal CD or Tape the sound isn't 'mixed' to the same degree to the speakers, so those tracks in 1&4 in the mod file ONLY go to the left and 2&3 ONLY go to the right... NO OVERLAP !!! and this leaves music sounding VERY cr*p through headphones.

I have 1 mod player that attempts mono and stereo, called 'The Jukebox' its a DA and works... sort of.

Unfortuanatly the routines used in the player just aren't fast enough.... even on my MegaSTE with a 16Mhz CPU, It can't do anything more than use its fastest routine (=lowest quality) at 50Khz, the other two options... Interpolated Mono and Mono Good s/n won't even work at 25Khz.

What I'm praying for is people like Griff who wrote the ProTracker Replay 50Khz, to perhaps ammend his code one more time, and add a mono option ??? then we get the excellent quality his mod player provides... even when used with headphones.

Sorry to cut this so short, but is there any other way of getting at
this software ???

Is it commercial, shareware or PD ??

The reason I ask is that 1) I don't have access to a CD ROM and
2)Don't live in the US, so buying from TOAD would be inconvenient

Could someone clarify for me ???

Thanks

Most programs should work on an STe. The only ones that don't are a few
old ones that use an older TOS. What you need is a TOS switcher that
toggles between 2.06 and 1.62 or something. TOS 2 always has problems
running real old software. For the real old stuff that won't run on any
of the above versions, try to find a TOS 1.0 disk. It should at least
work on that!

BTW, if you have complied STOS games that won't run on an STe, get STOS
Fix 3. Hope this helps...

> overscan can be done by software or hardware, or both.

In the XBIOS function I think, you can not only read the resolution mode number but actually can change it. On the ST, it's 0 for low, 1 for medium, and 2 for high. And I can switch between low and medium resolution for TOS programs, it messes up the GEM display which thinks it's on the old resolution but use a VT52 clear command and it works. This is what I'm going to do with the text file reader I'm written(after my game's done) and what Darek did with QuickView.

But there are the "extra" modes for higher machines like TT, Falcon, and even for Gemulator. If anyone can give me a good idea what these numbers are, that will be helpful. However, the program will switch to either ST Low or ST Med except when it's on those 'true' modes, not the extra ones on the Falcon. And yes, it won't do switching on a high rez monitor.

Those suposedly "built-in" MIDI ports on Soundblasters require an optional
$60 module to connect them to any MIDI devices, also. And since the
adapter plugs into the joystick port, you can't have joysticks and MIDI at
the same time on a PC without yet ANOTHER add-on card.

Form what I've seen Thing V1 is totally useless for english users....
because they can't get it.

AFAIK Joe Connor Supplies the English version of Thing V1, but ONLY to
people who have registered 0.59.

This is sort of wierd if you ask me !!! Why would anybody register an
old version of a program, when a newer one is available, and why would
people register a program, when they can't even try it ???

If it is illegal for us to translate and use Thing V1 then so be it,
but I doubt you'll get many people registering at all.... after all
why should anyone register shareware when they have never tried it ???

Its good to hear that SoftPC works so well... I got sick of waiting for a decent hardware emulator for the F030, so I sold it... :(

BTW, a Norton SI of 2.1 is not 286ish at all! Its really akin to an 8086 (true 16 bit Intel CPU) running at around 10Mhz... A late model PC-AT (w/a 286 at 8mhz) is around a SI of 5 or so...

Still, this sounds great considering that PC-Ditto gave me a Norton SI of 0.3 and my old IBM PCjr gave me a Norton SI of 0.7!!!!

>I think WWW130 is the newest version.

Yes

>But why I have read that the WWW117 package will once be ready?
>
>Does anybody know something about this?
>

The logical next release number for WWW after WWW116 would've been WWW117,
but due to a number of factors, including the premature appearance of a
beta package arriving on certain BBS sites or conferences, and the vast
amount of upgrading and new software included in the package the powers
that be (Flinny, AFAIK) decided to call this package WWW130 to distance
itself from the previous incarnations somewhat. However, upto the actual
release of the software it was always referred to as WWW117, hence the
calls for translaters etc for the "WWW117" package.

Fear not, Gerd, you've not missed anything!!!

Andrew

Hi I personnaly use 7up, it is pretty fast, and easy.
Or sometimes, I use Steno, which is not a shareware, but it is really cool because you can keep it as an accessory, it is pretty fast too, and you can close your text to do whatever and go back in the acc menu, your text is still here at the same place in the same paragraph, just waiting for you. It is very easy to use, it is also very handy to create your html document. I load it with CAB, it is perfect. It is also completly compatible with Stalker. Which I don't use, but, if you're on line, you can send your text on the line very easily. I don't know I hope , it will help you a little... Bye.

Games tend to be the first to fail with upgrades. Normal programs use
the operating system to perform tasks, games tend to access the
hardware directly. If the hardware has changed then ?!??

Also, even if the hardware has not changed but the operating system
has, then a game may make erroneous assumptions about where important
data is stored.

A typical example of this is the LineA interface. It's low level
enough to provide the ability to move sprites and so forth without the
programmer having to go to the trouble of directly manipulating the
screen. To use it requires access to special memory locations and
these can move about. Speed is all important in some games and the
programmer may have used the faster "absolute" access method, rather
than the "relative" one.

There used to be a command line accessory around years ago. I didn't
bother mentioning it because it was so unreliable.

Now, if you were to multitask then it is easily possible.

You are not doing anything wrong, there's a slight bug so it doesn't
realise when it has loaded the jpeg.

Jpegs get loaded then it just sits there. Hit Esc once and it will
carry on and the jpegs will show up. Trouble is, they don't get into
the cache because you have to hit Esc, so they get loaded again.

They are very compatible, however there ARE differences, and unfortunately
there are programs that will not work, especially older programs. STOS
was a major compatability stumbling block, as were some GFA programs I remember.

Patches/newer versions of most software however will now run TOS 2.06...

Just one of those things I'm afraid... :P

It appears that you must have the original CAB.OVL from WWW130 to be
connected - CAB_JPEG.OVL alone will not connect with STiK.

As to JPEGs, even when trying to view them with an external accessory,
it's seems rare to me that all the data gets sent. This has occurred
with all versions of CAB and STiK so far.

Is this a problem anyone else has been having using STiK/CAB combo?

>of selecting which drives have write verify on and which don't ???

My hard disk driver allows me to change write verification for each
partition.

Setting the system variable at 0x444 to zero turns off write
verification. I'm not sure if this just applies to floppies or to
partitions as well. I suppose it could depend on the driver in use.

Source record: 147177

dand1@azstarnet.com was caught by the fuzz while on the bus with All ...

d> 1. I have no discs. Do I need a system disc, or what? If so, where
d> might I find one?

Nope, all the system is installed inside the computer on ROM... that is why you get the green GEM desktop without having to put any disks in the drive.

Your next step will be to get loads of blank disks and start FTPing software from some Atari file sites.

atari.archive.umich.edu/atari/
micros.hensa.ac.uk/micros/atari/tos/

As you obviously already have another computer, you don't have to bother with extracting the archives on your ST, because your other system can handle them. Copy the now extracted programs out to double density disks (NOT high density because the ST can't read these) and bung the disks into your ST.

When you are at the green desktop, double click on the "A" icon and it /should/ read the directory of the disk and display the contents on the screen.

The square shapes that look like folders are the directories... and the rectangular shapes with black bars at the top are the executables. Read the documentation on the disk by double clicking on it.

The best way to do things is just by trial and error... you'll soon pick it up :)

Here are a few tips (which is basically a compact version of the ST Manual which you didn't get):

1. The right mouse button doesn't do anything.

2. You format a blank disk by highligthing "A" and selecting FORMAT from the menu.

3. You copy a disk by dragging "A" onto "B" and following screen prompts.

4. Dragging icons from a window onto the trash can wipes them.

5. Clicking on the top left of a window closes it.... the top right maximises it.... the bottom right re-sizes it... and the top middle m

6. Pressing <ESC> updates a window in you have changed a disk. This saves you from having to close the window then open it again.

7. Copy window items by either dragging them to "B" or dragging them onto another window.

8. Files with an .acc extension and called desktop accessories. When placed in the root directory they execute at boot up time, and are called by selecting them from the DESK dropdown menu. You are allowed a maximum of 6 accs active at one time.

9. Files with a .PRG extension are GEM programs and use the ST's GEM window interface.

10. File with a .TOS extension are TOS programs and use a text-only based interphase similar to DOS on the PC.

11. Files with a .TTP extension are also TOS executable programs, but a command line pops up where you can feed paramenters.

12. If a folder is created in the root directory called "AUTO", you can sometimes put executables int here that will run automaticaly at boot up

13. You can re-name files by highlighing them and selecting <SHOW INFO> from the dropdown.

14. Selecting <view><show as text> displays the window contents in a text only format, without icons.

15. If you highlight an executable and select <options><install application> you get a cursor followed by three spaces. Here you can type a three letter extension like .TXT. If you then double click on a TXT file later on, the executable that you highlighted earlier will load automatica

16. Clicking on <options><save desktop> will generate a file called DESKTOP.INF in the root directory. This file stores all the window posistions so that next time you boot up they are in the same place as when you saved the desktop.

: Having had a few lock-ups when CAB retrieves GIF images, I checked
: the main HTML code for the pages and found that the tags include sizing
: controls - ie width and heighth percentages. Is it because of these
: that the lock-ups occur ?

I have successfully loaded pages with width and height commands, although CAB hasn't scaled the images so they were displayed at the wrong size. But it didn't lock up either. I don't remember if the pages I loaded expressed the width and height in terms of a percentage of the window or int specific pixel dimensions. I know I've loaded pages using the latter. I'll give the percentage ones a try asap.

Actually, if this picture scaling were added to CAB another benefit would be the ability for the program to automatically scale images when running the program in ST-Medium or ST-Low modes so the display is better.

836. a similar TT RAM question

Newsgroup: comp.sys.atari.st
Date: 1996-04-13 00:00:00 UTC
From: wknaka@saul7.u.washington.edu
Message-ID: <4kotvu$bdv@nntp5.u.washington.edu>
Source record: 147179

What are the possible configurations for the SIMMs on the TT RAM board? Someone posted the jumpers that must be set if you have 4 1MB chips or 4 4MB chips. Is it possible to mix and match so that you have both 1MB and 4MB chips, and maybe some empty slots? Or are you stuck with all slots filled with like chips?

My suspicion is that all slots must be empty or full, with like chips, giving possible configurations of 0, 4, or 16MB. Right now I've got 4MB, and I want to upgrade, but don't have enough money for 16. Can I have 2 4MB SIMMs and 2 empty slots of TT RAM, or 2 4MB SIMMs and 2 1MB SIMMs?

I'm guessing that TT RAM is regular 30-pin 8-bit (no parity) 70 ns SIMMs. Is that right? What is ST RAM? If I've got extra TT RAM SIMMs, can I stick them in as ST RAM (realizing that they won't be as fast)?

Also, while I'm on the subject, m68k linux will use both ST and TT RAM (transparently) just fine, right?

TIA,
wes.

Try double clicking on the file name in the open directory
window. I assume you installed the icon on the desktop? I don't know why
but some programs don't seem to be able to find the files they need to
run when you just drop the icon on the desktop, (at least it seems that way).

It can be done however and I gues would be fun for someone. I did it on
2 machines, and upgraded 2.5 and 4 to 4 megs. You solder lagrger DIP
sockets, then run wires for the extra lines. You also need a couple of
extra RAS and CAS resistiors. Going to 2.5 meg is easier cause you
leave in the ram that's there. (520STfm)

Utter bullshit. All GEM programs are resolution independent.

Have you tried formatting them? =)

No seriously I never heard of such a program, however since you can use
crossdos on the amigo, why not convert the amigo disks to pc formatted disks?
The Atari will then be able to read/write them if all goes well.

I seriously recommend Edith, it's the perfect editor that's barely
short of being a word processor. You can use it as an acessory so it
should meet your needs. Of course, see if it'll work with your set
up as sometimes with different programs and accessories it'll get
goofy.

The only other text editor I use is Steno which is second best :)
But I only use it with Stalker for which it was made for.

Another one you can check out is SprirtEd which I got off a STF disk.
It's suppose to go with a bible study program, but the accessory
is pure GEM and works by itself. But for some reason, it gets weird
when I ran it under the Geneva demo. Any reason? :)

I live in an area that could possibly be noted for it's lack of ST support/sales, and was wondering if there was anybody that could tell me where I could get a copy of the latest version of Magic here in Southwestern Ontario.

I suppose I could order it from Toad, but I'd really rather not have to deal with the money exchange problem if I don't have to...

As a second note, I'd also like to find a SCSI host adaptor, but this is secondary to my desire for a copy of Magic.

TIA...

Hi,

If you realy need MIDI compatibilitie on a PC with Atari software, you must get the STzer from C-lab! It is an ISA-bus card with MIDI in/out and a ROM-port for your Dongle! Now you can run any Atari proggie on a PC!

More info later, its a brand new product.

Greeting, Jan Dooms.

Is it possible to run all the same programs on both an STFM and an STE 1040 computer, or will only certian programs work on certian machines? I always thought that they were COMPLETELY COMPATIBLE in EVERY way when it came to software (as far as being able to run programs I mean). I am beginning to think otherwise lately, as I tried to run a TOS version of SPACE INVADERS on my upgraded STE (with TOS 2.06 now installed) and it wouldn't work, but would when I had TOS 1.06 installed previously. Is software really that picky, or is there maybe something wrong with my computer. Please help me if you have any answers. Thank you:-)))

From: ae490@ccn.cs.dal.ca
Message-ID: <4kn214$gq0@apollo.isisnet.com>
Source record: 147349

I am a musician who uses Cubase version 2.0 and an Atari STE computer. Lately I've run into a problem when trying to boot the program. It all started just after I upgraded my TOS to 2.06 in my STE. Ever since then, everytime I double click on the Cubase program icon, it starts to boot but then a dialog box comes up saying "! MROS NOT FOUND", even though my MROS folder is on the same level as the program icon itself. I am totally baffled on this one. In the meantime I cannot use Cubase 'til I figure this out!!!! Oh, before the TOS upgrade it booted up fine, but I am hoping that there is something I can do to run it with 2.06 as I really do like the upgrade. If anyone can help, I will be forever grateful. Thank you:-))))

Sincerely,
Mark Anthony

Hi there...

There seems to be a number of posts about enhanced AES versions, Soft PC for the Falcon etc...

I run MiNT 1.12 (occasionally) so would be interested in trying Xaes or Naes or Oasesis or whatever they are called. Please tell me ftp site(s) I can visit to get the aforementioned, if they are publicly available...

I am also _VERY_ interested in Soft PC for the Falcon. AFAIK, this project got to completion, but was then dumped by the developers because Atari were a pack of ******s and decided not to $help$ out these guys...If this program is available then it should be mentioned where to get it from. Not all of us have the Power CD, so do not just say that. It also pisses me off enormously the number of smartmouth prats who post to c.s.a.st boasting what these programs can do and yet not saying how or where they got them from...

Hoping someone can come up with a helpful reply, not a pile of smegma!!

Chris Wilkinson.

>564 characters are enclosed and can be used provided you have made a
>mapping file

Not necessarily. You could also use a program that switches to direct Speedo-BICS-Mapping or -- with NVDI 4 -- to Unicode mapping. Such a program has to use 16 bits per character then. Papyrus 4 works like that.

With a mapping file you can only use 240 characters at a time. If you need other characters than defined in the mapping file, you have to install a different file and reboot. This is extremely uncomfortable when you need to write in various languages.

>Not a single TrueType can match that.

TrueType fonts shipped with win95 contain up to some 650 characters. The exact number depends on the language support chosen when installing win95 (foreign language support can be added after the installation, too).

BTW: Bitstream is currently developing a full Unicode TrueType font based on "Zurich BT". It's named "Cyberbit" and will eventually contain the full Unicode 1.1 character set. The roman weight of this font will be free of charge. See http://www.bitstream.com for more information.

>Jeszcze Polska nie zginela, poki my zyjemy

Hi Peter

I used Write On (the little brother of That's Write) for years, and I had a
similar experience. It occurred after I had installed Write On to a
particular partition, and then later moved all the program files to another
partition. When next running Write On, the 'standard key not found' message
came up. Only by re-installing the complete programme to the required
partition cured the problem.

I think that there is something internal telling That's Write/Write On
where to find certain files, and if you go and change things outside of the
program (by using Harlekin etc), the pointers or whatever point to the wrong
place. Sorry I can't be of more help, as I know how frustrating it is. But
hopefully someone might be able to suggest a cure for you and your friend.

> really do like the upgrade.

Hi Mark,
When I still had my Mega4 with TOS 2.06 I ran Cubase without any problems. However, it was version 3.0, but if I remember correctly I had an STe before, with which I used the 2.01 version without any problems. I believe it should work with your computer too - at least if it's an original and not a pirate copy... ;)
Maybe there could be poor contact between the copy protection key and the connector in the computer? If so just try to remove and replace the key a couple of times (with the computer turned off!) and you'll get the oxide away.
Maybe someone in the cubase-users group knows. You subscribe to it like this:

Send an e-mail to majordomo@mcc.ac.uk with no subject, and the following message: subscribe cubase-users your.email@address

You'll recieve a couple of e-mails every day and will be able to send your own questions to the group, as well as answer others' questions if you can. There are two of Steinberg's developers that occasionally take part in the discussions, so I believe you can get most questions answered.

Best regards,

Claes

> Is it possible that CAF can play midi, while it play samples?
> I mean, like a soundtracker, not direct to disk.
> Is the sampler complete, and good?
> What are the features?

Hi Katherine,
You can use sampler and RAM tracks, if that's what you mean.
The whole idea with Cubase Audio is playing midi together with the audio and the sound quality is like you set the sample frequency, 44.1 or 48kHz (or other, lower frequencies) and 16-bit (naturally). Sampler and RAM tracks are audio tracks that are kept in memory, instead of playing from the HD, but when recording you need to record them on the SCSI HD.
You can't really use this function as a regular sampler, because each voice takes up one track - so a 3 note chord takes up 3 audio tracks of the 8 (or 16, depending on your settings) available.
I use the sampler and RAM tracks mostly for drumloops (or other kinds of loops) and effects sounds the few times that I do use them.
You can assign each note on the keyboard a sound, like in a normal sampler, and use the sampler track as a drum machine with your own recorded sounds, but you can't play two sounds at the same time on the same track, so it's rather limited if you plan to use it instead of a sampler. It's best suited as a complement there. The sampler track is triggered by a midi track, just as if it was a midi instrument.
A RAM track is the same as a HD track, but it's read into the memory when the song is loaded, instead of getting replayed from the HD.

Best regards,

Claes

> normal TOS here:-)

I was just thinking, if you want to use a multitasking system like
Geneva or MagiC on Gemulator or STonX, why would you have to buy a
$60 TOS 2.6 chip if you're only going to use it for loading something
that requires a seperate desktop anyways? Wish you can get a cheaper
ad older TOS chip that do the job or better yet, a bootstrap program
that loads MagiC that replaces all of TOS anyways. Just a thought :)

Not that I'm aware of. Perhaps it'd be easier to convert them to another
format on the ST first, such as TIF...

Source record: 146919

Hello all, I have a local ISP that I access with a Pentium win95 at work. At home I have a Mega ST4 with monochrome running MagiC 4.02, NVDI 3.02 <grin>. I have a version (I know its not the newest) of CAB/STik www browser, but I can't use it because it requires a SLIP connection. I only have access to a PPP connection. I do however, have a copy of the 7 disk set Mint(unix) X-windows Environment that is said to use a PPP connection. I have nearly no unix or mint knowledge and would much rather stay in MagiC. My questions are:

==> Is there a package for a PPP connection that will run under MagiC?

==> Can the Mint(unix) stuff be configuered to run under MagiC?

==> Does CAB/STik support a PPP connection yet?

Any help would be greatly appreciated cause I'd rather use my megaST than the pentium. Also, I would like to add, MagiC is awesome, If you don't have it... GET IT!

Does anyone have the latest version of Cubase 2 (I've got version 2.0 and am having a problem with running it with my 1040 STE with TOS 2.06 installed). Apparently a newer version should run on my system, so if anyone has it, I would very much appreciate a copy if possible (either via E--Mail or snail-mail). Of course I DO have the dongle key and yes I DID pay for it, and besides, what use would the program be without the key anyway? So if you can help, this desperate musician would be a VERY HAPPY CAMPER INDEED:-)))))) THANK YOU.

Sincerely,
Mark Anthony

You can also use LPS.TTP (lps=long play sample) to play .au's and .wav's directly off your hard drive (i.e. not from RAM so size is unlimited). I think umich has it in the sound directory. works on any atari st (dma sound not required), any TOS.

Kinda off the subject, but I did finally get MagiC to run in fast ram on
my Falcon. Compairing the benchmarks, both TOS and MagiC running in fast ram,
MagiC results are slightly faster in some areas and slightly slower in others.
The overall percentage, according to GemBench, is about the same.
Considering the extra features of MagiC, I found this quite interesting
(As Spock would say). :)

phil4@phil4.demon.co.uk (Phil Hough) wrote:

>Does anyone out there know how to do the following:

>Get the directory listing in a string array ?!

[snip]

If I am mistaken, someone can correct me, but I don't
believe GFA has a variation to store a dir list to an
array.

The method I have used involves setting up a DTA which
is filled with GEMDOS calls to SFIRST and SNEXT after
setting up path mask. Then as much or little of the
data for each file found is extracted from the DTA.

I don't have my code at hand, but could send it to
you via email if you are interested. I used it in a
Music Program with its own 'custom' fileselector.
Compiled (or not) the routine is fast enough unless
you are reading the file names from a floppy.

Hope this helps.

Me too!

</AOL>

Seriously, Everest is pretty wonderful, fits your specs and has a set
of HTML shortcuts available which make it ideal for use with CAB, too:
just install it as the helper app for source.

By all accounts it's compatible with just about everything, too.

From: chriswil@southern.co.nz
Message-ID: <4kqevf$7fd@orm.southern.co.nz>
Source record: 147210

Hi there...

If Soft PC is available on the Power CD, then why isn't it being distributed across the net? One would assume that if the authors were happy enough to see their program placed on a PD/shareware CD-ROM, that they also wouldn't mind placing it on an ftp site. If they were not happy about placing it on an ftp site, then why the hell do they think that placing it on a CD is any different?

Come on people, someone must know if this program is available on internet or not. If it isn't, fine, I might just have to buy the Power CD (prefer not too, too much stuff repeats from one CD to another). If it is, then let us know where. If the authors of SoftPC are reading this then could you please clarify the legal status of SoftPC (shareware/freeware/etc...)....

Hope this gets through to someone...

>Is this a problem anyone else has been having using STiK/CAB combo?

I haven't had any trouble with this. There is a minor bug(?) which means
that when you return from an external viewer the information line gets
stuck on receive data xxxx bytes, rather than the usual update to the URL
once a transfer is complete. A mild irritant IMHO, but no more.

And surely the file won't get passed to the external viewer until it's
complete anyway?

Eric's right. You're main problem's TOS 2.06, I'd guess, not the STe
itself. I've had _no_ trouble with my TOS 1.06 STe as far as compatability
is concerned, and decided the MagiC upgrade route was more useful than a
TOS upgrade - if it doesn't work under MagiC it'll always work under
normal TOS here:-)

: version of Calamus and in Studio Photo...
If you have IMAGE COPY 4, use it to convert your TIFF files to ones
usable by Calamus and Studio Photo. Its usually just a matter of
converting them to uncompressed TIFF's. I think you may be able to do it
in GEMVIEW also but I prefer IMAGE COPY for it.

: Is there a photo-image program out there that actually can come close to
: photoshop?!?
DA's PICTURE is the closest I've seen. Positive IMage looks pretty good
too and much cheaper but I there some very nice features in DA's PIC that
I havent seen in POS IMAGE. You can get a demo of DAP from several sites.

Help wanted please!!!!

I've downloaded WWW 130 and have STiK up and running (tested it out on IRC) but I simply cannot get Cab to do anything. It all looks nice and seems to function fine on it's own, but whenever I try to actually use I get the message 'Read error in file '\-?\'' where '?' is the last word of the URL. This is happening whether I'm on line or not, so presumably it's something internal to CAB.

Can anyone tell me what I'm supposed to change?

Thank you, thank you.......

Did you put CAB.OVL in the right fldr; i.e: in the same fldr as CAB.APP
and CAB.RSC? Without OVL CAB thinks it should search documents off-line,
that is: in the cache. Of course it doesn't find the url, and there comes
the error msg: read error in file etc.

g> I can't understand why people don't just get MagiC meself!

Agreed... and I hope that all these people who are buying these TOS 2.06
upgrades realise that if they ever get MagiC, their TOS 2.06 upgrades will
become useless. MagiC totally replaces TOS/GEM and requires that you *have*
to install a replacement desktop... therefore TOS 2.06 doesn't even get a
look-in.

I bought TOS 2.06, then MagiC a month later. Since then I have never used,
or been able to use, my TOS 2.06 upgrade. A total waste of money. :(

So all you TOS 2.06 buyers... be warned! <g>

For complete compatibility programmers should not make assumptions about the screen size - think of the Falcon resolutions and colour depths and all those with graphics cards...

After 2 years of PC fever I digged out my old STF, cause those guys from
FTL didn't publishe Chaos Strikes Back on PC. But then I found that I'd
lost all my maps of this (still) great game.
So I wonder if someone out there has still some or all of the maps in
'digital' or knows where to get those. A search on the INet was useless
ONE hit on Dungeon master, none on CSB!

Very thankfull in advance,

Message-ID: <Pine.ULT.3.91.960414001331.23907A-100000-100000-100000@mhc.mtholyoke.edu>
Source record: 147233

Hi Guys.

I sometimes have a problem with my Falcon.
I have TOS 4.04 with an external SCSI drive.
Sometimes, when I'm on the Desktop, after opening some windows,
the mouse remains as the busy bee, and the windows blink.
I can still use the mouse to close window, and all is fine.
But if I open a window, it happens again, and it is also
hard to open the window(double click). It does that with all
the drives, internal or external.
It is pretty scary. Am I alone? What the hell is going on?
Any suggestion?
Bye..
P.S: Or should I just call " THE GHOSTBUSTERS"

Is the Cubase icon in a disk window, or on the desktop? TOS 2.06 lets you put an icon on the desktop. If this is the case, then I believe that the "Default Directory" parameters may come into play here. These are accessed on the desktop: "Top Window" and "Application" lets you choose which directory the app will consider as its default when it runs.

If the Cubase icon is on the desktop, trash it (the icon, of course!). Run Cubase by clicking on it in the disk directory window. Maybe that'll help.

I solved it by renaming the files in the mros dir to files with the
same extension, but in stead of the last character an x
so foo.bar -> foo.bax
This helps with me (It takes too long to explain why, I partly
disassembled the code)

Good Luck, email me for questions, I do not have my
Midi setup with me. I will check at home

From: afn14016@freenet.ufl.edu
Message-ID: <4kr8i5$fvg@huron.eel.ufl.edu>
Source record: 147237

Hi friends:

I need your help solving what I believe to be a real mystery.

I finally got CAB/STIK/ANT mail to work great, but under the same set up, same ACC , same AUTO programs it would work great and then next time I connect it won't!

I have had this problem with STIK/CAB since WWW116. I have experimented and found no reason of why this happens.

It might be a server problem but one thing I know, when CAB works ANT Mail also works. I can receive and send mail while CAB is also loaded etc.

I tried with HMONDEM 6 etc. It makes no difference. Under the same configuration it works sometimes and the next connect it won't until I try may be 15 times and then it will.

Have you had this problem? Thanks , Raymond.

This then assumes your ISP is providing POP-3 mail. Antmail doesn't fully
handle SMTP, which is the standard mail protocol for many ISPs, eg. Demon
in the UK!

From: Neil@yr-ynys.compulink.co.uk
Message-ID: <58189421_OASIS_NEWS@yr-ynys.compulink.co.uk>
Source record: 147239

>This is sort of wierd if you ask me !!! Why would anybody register an
>old version of a program, when a newer one is available, and why would
>people register a program, when they can't even try it ???

The English Thing v1 is a beta. When it's finished it will be released
as shareware (AFAIK). If you want to try Thing then get the English v0.59
which works perfectly well; if you like it enough to register then Joe
will send you the v1 beta to play with.

It all seems perfectly clear and sensible to me.

Best wishes

Neil

932. Hard drive/Mega STE problem

Newsgroup: comp.sys.atari.st
Date: 1996-04-14 00:00:00 UTC
From: chris@cpoole.demon.co.uk
Message-ID: <829589994_OASIS_@cpoole.demon.co.uk>
Source record: 147242

A question that I hope the SCSI buffs can help me with:

I have a Mega STE with an internal Quantum 170 Mb drive which is getting rather crowded. I have bought a 548 Mb drive to replace it, but am having trouble getting the Mega STE to recognise the new drive.

I know the drive's parity should be off, and the SCSI id should be 0, but I do not know how to change the settings. There is a row of seven (unlabelled) jumper pins on the drive, some of which have jumpers fitted. So the first question is, can anybody tell me which pins need to be jumped?

BTW, the drive's label describes it as an IBM, model no. DSAS-3540, made for IBM by Satsuma and it also says the factory setting for SCSI id is 6.

I'm using HD Driver v.4.5.

And another thing, is there any way I can connect the drive activity LED to the new drive? The old Quantum drive has a connection for it.

Thanks in advance.

In message <4kotvu$bdv@nntp5.u.washington.edu>, wknaka@saul7.u.washington.edu said:

>What are the possible configurations for the SIMMs on the TT RAM board?

On the Atari 4/16 MB TT RAM board, you can have, 4 x 1MB, or 4 x 4MB,
30 pin, 8 or 9 bit, SIMMs, 70ns are ok, you can also use slower SIMMs.

> What is ST RAM?

This is RAM which is configured in the same way as RAM on the ST, it is
shared by both processor and video. TT RAM isn't shared with video,
and giives faster performance.

> If I've got extra TT RAM SIMMs, can I stick them in as ST RAM

No, the motherbooard includes soldered ST RAM, 2MB IIRC, additional ST
RAM sits on daughterboard, on the Atari board the RAM is also
soldered.

Having to press Esc 12 times on one page is slightly more than a mild
irratant!
>
> And surely the file won't get passed to the external viewer until it's
> complete anyway?
You'd really think so wouldn't you! Only thing is if you press Esc, it
takes what is there now! Half a pic, no eof, or whatever!

You can use the FILES "filespec" TO string$ method to store a dir into a
string, but not an array.

937. Autoboot and XControl

Newsgroup: comp.sys.atari.st
Date: 1996-04-14 00:00:00 UTC
From: tparrett@parrett.fast.co.za
Message-ID: <829592992_OASIS_@parrett.fast.co.za>
Source record: 147247

I have noticed that after exiting a prg that I have previously started using the Autoboot facility,an attempt to access a CPX module in Xcontrol causes a two bomb crash. My machine is a Falcon. Has any Falcon owner come across this. If I disable the Autoboot and start the programme using a function key I don't have the same problem. By the way this problem is not specific to any particular prg.

> Can they be used with the Blow-Up FX?

You need to keep say 4MB on the Falcon and put additional RAM, eg
2 x 4MB, or 4 x 1MB, or 2 X 1 MB, or 2 x 1 plus 2 x 4MB on the FX
card. The SIMMs are 30 pin, 8 or 9 bit.

> 2) How extensive / intensive is the installation process for
> the board?

Some of the track cutting and soldering is a bit tricky.

> 3) Is the board compatible with ScreenBlaster II?

Should be ok, however BlowUP Hard1 comes with the FX card, so you
could install that and sell your Screenblaster.

> 4) Are there any heat problems with the CPU or DSP chips when
> the accelerator is enabled?

I use a heatsink fan to blow air under the FX board and over the
68030.

Tom:

Thanks for replying so quickly to j.aubrey from the UK about North American ST mags.

Current Notes is indeed alive and well. The March - April issue should be in readers' hands either right now or very shortly. It is the 4th (fourth) bimonthly issue of Current Notes since it was transferred from Joe Waters in Virginia to Howard Carson and Robert Boardman in Toronto, Canada.

I don't want to be rude and make a sales pitch right here. Anyone interested can send email to redfrog@io.org or hcarson@io.org as Tom suggested.

Copies are also available in major Atari retailers in the U.S. like Toad and STeve's.

I have a problem in that when I dial into my ISP it sometimes takes 3 to 6
redials to get a carrier. My system is a Falcon with a 28800 USR modem. I have
installed HSMODEM. When I do connect it it almost always at 28800 but is
occasionally a little lower but never as low as 19200.
I have both FPATCH2 and HSMODEM installed. Could there be a conflict here.
The software is OASIS 1.35
Any ideas anyone ?

Hi Katherine,

Try tapping (refrain from smashing) the ESC key. This should stop the
problem. It seems that <most> Falcons have this bug.
I have seen a post concerning a hardware fix for this problem
here in the newsgroup, but the ESC key "fix" does not require a soldering iron :).

: MagiC results are slightly faster in some areas and slightly slower in others.
: The overall percentage, according to GemBench, is about the same.
: Considering the extra features of MagiC, I found this quite interesting
: (As Spock would say). :)

On my TT the disk performance in MagiC is significantly higher,
compared to TOS 3.01 (in ROMs). Of course, I use Hddriver and Wbdaemon.
I hate benchmarks. A real application is doing a backup. I very often copy
about 80 MB from my internal disk to a syquest cartridge. This is extremely
slow with TOS. Further I often use an assembler, that does bytewise reads
and writes. This is in MagiC two times faster than in TOS.

But I must confess, I do not have a Falcon.

Exactly. There is a Twrite.inf(?) config file which should be in either the
root directory or the same directory as the Twrite.prg. Deleting this should
restore sanity while you load Twrite and save a valid one.

Another Atari to PC file transfer question:

I need to use an IBM compatible PC to read some floppy discs written by an Atari ST 1500. I have access to the Atari ST 1500 which wrote the discs.

Can a PC read 3.5" floppy discs written by an Atari ST 1500?

How would I go about converting First Word Plus files to rich text or some such so that I can read them into a PC WP program?

How would I go about reading Data Manager Professional files into a PC spreadsheet?

Thanks in advance for any suggestions!

It would be nice, if for once, the whole file _was_ transmitted! Thank
heavens for the ESC key!

> You'd really think so wouldn't you! Only thing is if you press Esc, it
> takes what is there now! Half a pic, no eof, or whatever!

I take it, then, that downloading JPEGs is a problem on all formats -
i.e. the last few bytes of data are nearly always never transmitted ?
Good ol' pain the bum!

Anyway - here's a thought: CAB obviously goes through the HTML, checks for a link and downloads it as necessary. Wouldn't it be a nice idea if, say, at the top right of CAB's button bar it told you how many more links need to be downloaded (i.e. counted them down) and also it told you what the extension of the file was that was currently being downloaded - then you could press ESC to your heart's content in all the right places!

963. Configuring MiNT-Net

Newsgroup: comp.sys.atari.st
Date: 1996-04-15 00:00:00 UTC
From: Daniel Schaller <Daniel.Schaller@stud.de.epfl.ch>
Message-ID: <31722C11.7AF4@stud.de.epfl.ch>
Source record: 146948

Hi

I'm looking for somebody out there helping me configuring MiNT-Net.
For connecting to the internet, I use the tardis-a1 server of the
ETH in Zurich using SLiRP. Starting SLiRP on this server
gives me the following:

```
>tardis-a1[ajschall] slirp
>Slirp v1.0c (RELEASE)
>
>Copyright (c) 1995,1996 Danny Gasparovski and others.
>All rights reserved.
>This program is copyrighted, free software.
>Please read the file COPYRIGHT that came with the Slirp
>package for the terms and conditions of the copyright.
>
>Reading config file: /home/ajschall/.slirprc
>Setting baudrate to 28800
>Escaping: 0x0
>IP address of Slirp host: 129.132.3.11
>IP address of your DNS(s): 129.132.98.157, 129.132.98.12, 129.132.2.21
>Your address is 10.0.2.15
>(or anything else you want)
>
>Type five zeroes (0) to exit.
>
>[autodetect SLIP/CSLIP, MTU 552, MRU 552, 28800 baud]
>
>SLiRP Ready ...
```

So I configured the files of MiNT-Net 0.80 as follows:

```
/etc/domainname
nirvana.org

/etc/hostname
me

/etc/hosts
127.0.0.1 localhost loopback

10.0.2.15 me.nirvana.org
129.132.3.11 tardis-a1.ethz.ch

/etc/networks
loopback 127
```

/etc/resolv.conf
domain nirvana.org
nameserver 129.132.98.157

So after I've established the connection and started up SLiRP, I set
up the loopback interface as follows:

ifconfig lo0 addr 127.0.0.1 up

Thereafter I establish the SLIP connection:

slattach -l me.nirvana.org -r tardis-a1.ethz.ch -t u:/dev/modem2 &

After having done this, ifconfig lists me the following interfaces:

lo0: flags=0x4b<UP,BROADCAST,LOOPBACK,RUNNING>
inet 127.0.0.1 netmask 255.0.0.0 broadcast 127.255.255.255
metric 0 mtu 16384
in-packets 0 in-errors 0 collisions 0
out-packets 0 out-errors 0
sl1: flags=0x51<UP,POINTOPOINT,RUNNING>
link-level-flags=0x10
inet 10.0.2.15 netmask 255.0.0.0 dstaddr 129.132.3.11
metric 0 mtu 2000
in-packets 0 in-errors 0 collisions 0
out-packets 0 out-errors 0

The system's routing table looks like this:

Destination Gateway Flags Ref Use Metric
Iface
default 129.132.3.11 UGD 1 0 0 sl0
129.132.3.11 * UHD 1 0 0 sl0
10.0.2.15 * UH 1 0 0 lo0
127.0.0.0 * U 1 0 0 lo0
127.0.0.1 * UH 1 0 0 lo0

I tried then to use ping for testing the connection. The RX and TX
LEDs of my modem flashed up two or there times, but then was silence.
Ping didn't even print an error message. So what's wrong? I just
think that there is a route missing, but since I'm not very familiar
with TCP/IP, I don't know which route this is. Everything I see
are numbers with points between them. Please help me!!

Bye

Dani

> right smack in the middle of the motherboard) the one closer to the front
> of the machine should be removed, have the pins cleaned, and placed
> firmly back in the socket, and the drives should start working again.

ok, I opened up the 520ST, first, the RF shield wasn't quite set
right, the rear end was floating above the motherboard, the previous owner
apparently did something with it. Removed the shield, and staring me in
the face is "Aerco easieST Soldierless RAM". Anyone got info on this
board? (It's quite obvious what it's purpose is, but I wouldn't mind
knowing more) Half of the 32 sockets are filled (on the RAM chips is
marked KM41C1000AP-8 943 KOREA) The board is connected via one of the
two square sockets described. Is there some better, almost puzzle-solution
like, way to place the board (or do I have no choice but to let back of the
RF shield float.)

Now I just need to find the chip puller to remove the other
"square" chip described.

: >contains only a 'Cancel' button along with the message. The only way he can
: >start That's Write is booting from the That's write program disk, which of
: >course leaves him without the ramdisk and the other stuff he'd set up.

: Hi Peter

: I used Write On (the little brother of That's Write) for years, and I had a
: similar experience. It occurred after I had installed Write On to a
: particular partition, and then later moved all the program files to another
: partition. When next running Write On, the 'standard key not found' message
: came up. Only by re-installing the complete programme to the required
: partition cured the problem.

Try first to delete the TWRITE.INF in the TWRITE-directory so the prog is
forced to save a new .INF-file!
This might help. It does help, when changing the starting partition
simply by copiing the whole directory-bunch to another place.

: I think that there is something internal telling That's Write/Write On
: where to find certain files, and if you go and change things outside of the
: program (by using Harlekin etc), the pointers or whatever point to the wrong
: place. Sorry I can't be of more help, as I know how frustrating it is. But
: hopefully someone might be able to suggest a cure for you and your friend.

See above.

Bye,

Kerstin

Gaven Miller (gmiller@inca.co.nz) wrote:

: Modem 1 and Serial 1 are limited to 19200, as they are both controlled by
: an MFP chip (Motorola 68901)
Really? On my TT, I'm pretty sure Serial 1 goes a lot higher. The only
problem is the bps rates aren't "standard" ones like 38 400 or 57 600, so
I doubt if they could be used with a modem.
: Modem 2 and Serial 2 are capable of higher speeds as they are controlled
: by a different serial controller (NCR 5301).
Could have sworn that it was a Zilog SCC chip, but maybe newer versions
of the TT used a different chip...

Date: 1996-04-15 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <4ktl8n$m35@madeline.INS.CWRU.Edu>
Source record: 146954

How does (or can) one use serial 2 on a TT? I have HSmod06
which gives only some speeds on Modem 2 and other speeds
on Serial 2 of a TT. Both have 38400, but modem 2 has
76800, while serial 2 has 57600. My Magnum 144 can only
use up to 57600.
Setup, a wonderful addition to cab/stik, only seems to
allow Modem1 and 2. Or am I missing something?

I have to agree with those that find the hsmodem6 doc among the most incomprehensible I have ever run across! I couldn't make heads or tails out of the various setting, and couldn't get it work at all! I gave up and went back to serialfix 20 and it's cpx! At least these can handle the do-it-yourself 38.4k bps serial hack I have installed in my STe. Someone once told me to read an article in ST Format that supposedly explained it all! Well here in the American Heartland (Ohio) it seems that the only time we get UK magazines is when they are remaindered! Any Issue that has really good software on the cover disk never make it to my local Little Professor book store! Must have been something good in that issue because I never got to see it much less buy it! Any one of you people that have hsmodem actually working want to make up a hsmodem for dummies file and post it somewhere so the rest of us can admire your intellect? Because I am really tired of hearing them tell us to use it with no further instructions on how!

I'm sure that Toad is quite capable of handling the currency exchange relatively painlessly. But if you are going to end up mail-ordering anyway, why not give Computer Direct a call? At least you can miss the currency exchange hassles - they are in Edmonton. I met Chris Krowchuk at the Sacramento show, and he seemed to be a friendly, upfront guy, very helpful with a demo of InTouch. And doing the Sacto show in the middle of STeve's country obviously proves something, although I don't know what. I have his catalog here, which gives the following contact numbers: Sales, service, support (24 hours, 7 days) - 403 496-2488. Or you could call his BBS 403 496-2489.

I am not affiliated in any way with Computer Direct. I just think that this outfit deserves a chance in this market.

AS> never used, or been able to use, my TOS 2.06 upgrade. A total
AS> waste of money. :(So all you TOS 2.06 buyers... be warned!
AS> <g>

So I have a question. I have a TT with TOS 3.01, which doesn't have support for HD floppies. If I buy a HD drive and MagiC (and an Ajax controller, I would think), and install HSModem, will that do the job, making the upgrade to 3.06 unnecessary? Or is there something else I should do or buy?

I have not noticed any bugs with 3.01, but I dislike patch programs (like SerialFix) - my auto folder is already huge.

I suspect that some of the 'upgraders' are like me - I want to exhaust the possibilities of NewDesk before I abandon it. For a TOS 1.4 user, NewDesk feels like the promised land! (I spent some of last night making and installing icons - fun!) And remember that the battle rages on about the 'best' replacement desktop to use with MagiC. I don't have the dough to just go out and buy MagiC any time I feel like it. So I have seriously considered upgrading to 3.06, even though I expect to get MagiC sooner or later.

>hsmodem settings.
>

I use HSmodem 4 on my TT, Modem 2 will go all the way upto 156000 baud,
but is only useable at 38000 as my Accura 288 modem does not support this or
the 73000 bauda also available on Modem 2.
I personally use Serial 2 which works quite nicely at 115200 baud
(top spedd on my 288) Serial 2 also provides the 57600 that a 144 modem
requires.
While on the subject of TT Serial ports, I noticed in the STIK/CAB
setup program you wrote Guy, that the only ports you allow the user to
select between are Modem 1 and 2, whatever happened to Serial 1 and 2 on the
TT? I know ther aren't many of us TT ysers about, but the whol;e of the
Atari community is pretty much a minority nowadays, why make one small group
of us feel even more eft out.
Sorry if this sounds like a gripe, but I have owned a TT since 1990 and
got even less supprt from Atari than Falcon owners did (if that is at all
possible!).

I don't know what Abacus has to say about it, but the ICD utils let you switch hard drive write verify on or off. Of course, unless one is using an old MFM or RLL drive, the speed penalty for write verify is a very low cost for the extra data security.

In article <960413Z191720.365jpartner@track83.demon.co.uk>, jpartner@track83.demon.co.uk (James Partner) writes:
#>Question: Regarding the extra memory, does the Falcon 'see' any extra memory
#>as free memory on the desktop System Configuration (M key) screen, or does it
#>behave like a PC (spit!) with expanded memory, ie, the usual memory is there,
#>but the extra is seen as expanded memory?
The extra memory is installed as "Alternate RAM", just as it is on the TT.
That means, you have to kinds of memory, and you can't link them togehter.
For example: If you have 4MB in your Falcon and add another 4 with the FX,
you may only allocate 4 MB at once, not eight. But, of course, you may
allocate 8 MB in smaller chunks, e.g. 2 x 4MB.

So, as most programs do not need that much memory at once, Alternate RAM will
just raise the ammount of free memory, unless the program header disallows
the usage of Alternate RAM (which makes sense in some special cases). As far
as I know, though, the desktop won't display the correct ammount of free RAM,
as it just looks how much ST-RAM as free. I'm not sure about that, but I
remember that virtual memory added with Outside (which is Alternate RAM as
well) wasn't shown by the desktop and/or the Status-CPX.

Ciao

Thomas

P.S.: The problem with "expanded memory" has nothing to do with the PC-
hardware, it's a problem of DOS. E.g., you can happily access all
the memory in your PC using Linux or some specially compiled programs
(for example those compiled with gcc for DOS).

: >in my TT (4+4) and/or on my 1040STf (16 MHz,4MB) to do anything higher than
: >19.2. Both computers are not modified in the modem hdwe.

What serial port do you use? There should be no problems with Modem 2 or
Serial 2.
On Serial 2 the maximum speed without hardware modifications should be
115200 bps, modem 2 should do with 76800 maximum speed. Some modems do not
support the speeds higher than 38400 at modem 2. But at least 38400
should be possible.
I tried both ports and both work!

What terminal software do you use?

: Forget it. HSmodem totally screws up with a TT. Whatever port you're
: using, it doesn't matter.

I don`t know about your experiences, but it works fine with my TT. If
your Modem 2-port is modified to do speed rates same as Serial 2, you
even need HSMODA06 to make your system supporting these changes.

high speed rates of the SCC-ports
Modem 2: 38400/76800
Modem 2 modified: 38400/57600/115200
Serial 2: 38400/57600/115200

Bye,

Kerstin

993. Re: transfer data atari st -> pc

Newsgroup: comp.sys.atari.st
Date: 1996-04-15 00:00:00 UTC
From: BobR <76702.1466@CompuServe.COM>
Message-ID: <4ktu8maur1@mhadf.production.compuserve.com>
Source record: 147068

>Nb. AFAIK PC viruses will not have any damaging effect on the Atari,
>and vice versa...

This is true...

But they may have damaging effects on your own personal sanity.

Using this same scenario of formatting a floppy on the PC, then copying files onto the disk with my ST to move them to the PC, I ran through all the steps, only to have the PC tell me it couldn't read the disk.. the one I'd just formatted ON the PC moments earlier.

After repeating the steps several times and banging my head on the table for a while, I discovered there was a Key Virus in my ST, which was overwriting the boot sector on the PC formatted floppy, making it unreadable by MS-DOS.

Argh..!

BobR

994. Re: Write Verify ???

Newsgroup: comp.sys.atari.st
Date: 1996-04-15 00:00:00 UTC

Source record: 147069

Re: Write verify... on vs. off

I'm at work right now, and can't check my Abacus book on ST drives, but
I *think* I remember that the Write Verify switch only affects floppy
drives... (I'm probably wrong, of course).

The speed difference on hard drive writes would probably be very slight..
hardly worth the risk of losing data.

The speed difference on floppy disk writes is noticable, but again, hardly
worth the risk of losing data.

995. UK: Latest Issues of Current Notes for Sale

Newsgroup: comp.sys.atari.st
Date: 1996-04-15 00:00:00 UTC
From: efac001@alpha.qmw.ac.uk
Message-ID: <4ktunh$l5p@epsilon.qmw.ac.uk>
Source record: 147070

UK users - now is your chance to buy the latest issue of the Canadian
Atari Mag Current Notes.

Price 4.50 UKP including postage.

To reserve your copy now, e-mail me and I will reply with a
confirmation, upon which send me a cheque for 4.50UKP payable to

CyberSTrider

and send to

CyberSTrider
203 Parr Lane
Bury
BL9 8JW

First come first served.. so place your order now!

Here is a description of the latest issue:

==
CURRENT NOTES is out! The MAR/APR issue is jam-packed with news,
information, reviews and support; everything you need to help
get the best from TOS/GEM computing, Geneva, and MagiC, MagiCMac!

IN THIS ISSUE:
- Reviews: Keyboard Gizmo, Electronic Spinster Graphics CD,
Pixart, Parafin, Backwards, and a whole lot more*
- Our series on Personal Info Managers continues with CardFile*
- alt.info.everything*
- 8-Bit updates. Important new information*
- Color DTP processing techniques*
- Troubleshooting MIDI (and everything else!)*
- Our new series on MinT and MultiTOS/AES 4 begins*
- Small Office/Home Office. Work smart*
- Creeping consumerism*
- Atari Corp/JTS merger*
- Web sites, CDs, Wave Cable telecommunications, new products*

If there is enough interest, you may make subscriptions via me.

Regards
Danny

996. Born Again ST-er

Newsgroup: comp.sys.atari.st
Date: 1996-04-15 00:00:00 UTC
From: aherbert@hpqt0251.sqf.hp.com
Message-ID: <DpwKn1.Mxt@hpqmoea.sqf.hp.com>
Source record: 147071

Heigh Ho

This is going to be a fairly lengthy message, so I'd go get a cup of
tea first. I'm full of questions and can't find an FAQ to satisfy my need for
knowledge. The gist is this.

My ST has been lying unused for about 4 or 5 years now, it was my second ST
and is an early 1040 STE, with the dodgy TOS in it. Recently I acquired some
PC bits which I thought I would fit to it (memory chips hard drive et al.) Of
course not having opened the thing in years I didn't realise it's SIMMS were
not the same as the PC SIMMS and of course I'd forgotten it was a SCSI and not
an IDE controller.

So my questions are things like:

1. Could I use PC SIMMS in an ST?
2. Could I use an IDE drive in an ST?
3. Is there anyway to get a better TOS? (I can blow my own ROMS if need be.)
4. Where do I get those funny monitor plugs so I can hook up a VGA monitor to
the beast.
5. What are Atari doing now anyway?

I'm an averagely incompetent electronics engineer, with a leaning towards MIDI
and strange noises, who gave up his ST as it was too stupid and he was fed up
with floppy disks holding about a quarter of a sample he wanted to keep.

My ultimate aim is to get the ST back in shape but this time with a monitor,
hard drive and more RAM, hooked up to my Yamaha (synthesizer not motorbike :))
for the purpose of creating more wierd and wonderful answer machine messages
than ever before.

My net access is restricted to e-mail and newsgroups, so please don't upset me
by pointing me at the WWW :)

Failing this, the ST will be retired again and only brought out on special
occasions for quick games of Lemmings.

Oh yes, one final thing, the ST comes/came with a VT-52 terminal emulator, is
there anyway of getting a VT-100 emulator, so I can dump my old HP terminal.

I thank you for your indulgence :)

No jpegs aren't a problem on all formats! I meant that when I put the
ones from my cache on a floppy and walk them over to my son's 100Mhz
Pentium machine to see what they are supposed to look like, that quite
often the Window's viewer chokes on them! Whereas the ST's viewers quite
happily display whatever managed to get thru!

That would be nice! Next best is look at the source to find out why
whatever happened, happened!

True, MagiC totally replaces the rom operating system so there is no
point in upgrading the chips and the prices are comparible. Like
Andrew says, you may initially still have the same problem but at
least you will know you are not flogging a dead horse trying to find a
solution which may not exist under TOS 1.0 and for which one
certainly exists with MagiC.

To date it will. This can be quite handy on slow sites. I used to hit
escape, up came the external viewer to display what it could of a jpeg
so I could decide to go to text only mode or not.

iirc, modem 2 can run fast enough to drive a 28800 modem provided you set up hsmodem accordingly. Use the setup program to alter your modem speed and modem port - if it acts strange on you then look at the hsmodem settings.

Are there Atari lasers out there for sale. Not interested in the older 800 series but the last one Atari made, I think Atari 605 or ?? Anyway, if you have one that works well, let me know.

1014. HELP: Networking Atari STs

Newsgroup: comp.sys.atari.st
Date: 1996-04-15 00:00:00 UTC
From: csupw@csv.warwick.ac.uk
Message-ID: <4ku7fm$ko0@holly.csv.warwick.ac.uk>
Source record: 147089

We are currently using ten stand-alone STF/STFM/STE/Mega machines (1040s) in a music room at a school. Are there any products for networking these machines, not using MIDI ports as these are required for music.

Can a PC be used as a server if such a product exists? What sort of data transfer speeds can be expected, preferably at a reasonable speed without costing too much?

We have heard there may be a German product called Bionet available...?

Thanks in advance,

Patrick

I guess this means that you'll be selling the 2.06 then... ;-)
I wouldn't buy Magic anyway since it isn't compatible with Notator SL
(MIDI sequencer/notation software).
I might however buy Magicmac later as I might be buying a Mac to use in
addition to my STe.
I've personally never had a thought of regret about upgrading to 2.06 even
though I understand that Magic is something completely different.

Check on the boot up, but I am pretty sure the ID of your internal drive is 0.
You should be able to stick any SCSI drive in there, as long as it physically
fits. The utility that causes your Connor to boot is probably either
shdriver.sys[Atari hard disk boot], or icdboot.sys[ICD hard disk boot].
both of these have utilities to format and partition your hard drive, and
install a boot sector on them.
the SCSI ID AFAIK has to be 0 to be able to boot from that drive, the
exception being the Falcon which can boot from the internal IDE.
This hard drive software is available at most major ftp sites.
> Also, I'm getting a 486 in a couple of weeks that has 540M IDE HD that >I'll
be immediately upgrading to a 1G, any hope of using this? it's, of >course and
internal drive and I'll probally have to purchase a case and >power supply etc
to use it with the Mega. Is this feasible or would I be >better off selling it
and buying a SCSI?> I just got a bump up at work...a fool and his money are
soon parted...;)

Why buy a 486!!?
I'm not dumping on them, I have a 386 now which I have *only* to run software
I use in my full time job.I've owned a dos box since 1980, but use and like my
Atari more. Perhaps that is your situation also.

As to the IDE situation - yuk!
I have _tried_ to hook up 4 different IDE drives on my 386, none of them work
together. so I have 500MB total hard drive space but can only use 200MB. It
costs more to go SCSI for dos boxes, but is worth it - especially with wide
SCSI etc. with some you can hook up to 14 devices. SCSI is more reliable, more

throughput, and wider bus in some cases than IDE. In comparison I've never had a problem hooking up ANY SCSI device to my Atari.
sell the IDE and buy a SCSI :^)
you could use the IDE _in_ a Falcon if it is 2.5" form factor. external otherwise.
for the external SCSI drives, buy a tower case w/ power supply. SCSI cable from the TT to the 50pin SCSI ribbon cable, attach your devices to that and away you go!
Good luck.Bonne chance

I remember reading somewhere (it could have been in the MagiC manual
itself) that it can be blown into rom. I don't know if any changes are
required.

Are we talking about the desktop autorun option here? If so then I
used to have similar problems with it under TOS 1.4.

To some extent, I still get it under MagiC with Ease. Nine times out
of ten it works fine then for no particular reason, one or more the
the autorun processes will not appear. MagiC's program manager shows
them loaded and running ok but they will not respond - they seem to
have just "lost" their windows.

A wild shot in the dark - maybe the same happens under TOS but it
crashes instead?

>the discs.
>
>Can a PC read 3.5" floppy discs written by an Atari ST 1500?

1500? there's ST 520's, and 1040's - doesn't really matter, provided
it is an ST then the answer is the same.

No & Yes. No because the PC has a bug introduced in its code which
makes it insist on one byte in the bootsector being set to a certain
value. Yes because newer ST's format their disks with this value set
correctly to stop PC's barfing, so just try it first. If it was an
older ST then a disk sector editor can be used to change the byte
manually. This doesn't affect the ST 'cos it ignores it anyway.

The big problem arises if an extended disk format is used. The
standard format is 720K, that's doubled sided, double density, 80
track, 9 sectors per track (the PC standard before HD drives were
introduced). ST's can write more sectors per track and more tracks
than usual. If this is the case you will need to find some special PC
software that is intelligent enough to access it. The extended formats
are physically accessible to a PC, it's the software which can't deal
with it.

>How would I go about converting First Word Plus files to rich text or
>some such so that I can read them into a PC WP program?

This bit's easy. The shareware word processor Marcel can import
1stWord files and can export RTF.

>How would I go about reading Data Manager Professional files into a PC
>spreadsheet?

Haven't a clue! See if it can output comma delimited stuff.

PPP support is high on the list of things to implement with STiK but
don't expect it next week. There are other slightly more fundamental
problems that have to be dealt with first.

If you are desperate to get Cab working then you will have to install
at least a minimal Mint system. I don't know if this requires a Minix
file partition or not but with a decent boot manager it would be
fairly painless to switch between the two.

>Also, I would like to add, MagiC is awesome, If you don't have it...

On Mon, 15 Apr 1996, Andrew Herbert wrote:

> 1. Could I use PC SIMMS in an ST?

I don't think so. STe's use 1MB x 8, 30 pin while PC's use 1MB x 9, 30
pin. I can see where the mistake lies.

> 2. Could I use an IDE drive in an ST?

I doubt it as well. There might be a German board you can plug in that
uses IDE drives, but I know very little about it. Besides, you're better
off with SCSI anyways since it's more efficent.

> 3. Is there anyway to get a better TOS? (I can blow my own ROMS if need be.)

You can buy TOS 2.06 roms at a place like Toad Computers. If you're
going to use MagiC, then don't bother getting a new TOS as MagiC
completely replaces it.

> 4. Where do I get those funny monitor plugs so I can hook up a VGA monitor to
> the beast.

There are multisynch switch boxes that lets your multisynch monitor use
all three resolutions, but you need an old monitor like NEC Multiosynch
3D or any that has a horizontal scan rate of 15.75Kh. Nobody makes those
anymore I'm afraid :(

> 5. What are Atari doing now anyway?

After cutting out all computer support and nearly ruining the 64-bit
Jaguar, they have merged with JTS who makes hard drives. Atari is now
making games for the PC.

> I'm an averagely incompetent electronics engineer, with a leaning towards MIDI
> and strange noises, who gave up his ST as it was too stupid and he was fed up

> My ultimate aim is to get the ST back in shape but this time with a monitor,
> hard drive and more RAM, hooked up to my Yamaha (synthesizer not motorbike :))
> for the purpose of creating more wierd and wonderful answer machine messages
> than ever before.

Call Toad Computers at (410)-544-6943 to get who started on upping your
ST. If you 'really' want an excellent music computer, look into the
Falcons which not are nearly ST compatible but record whole songs on
HD's. Your ST can do alot more than you think it can. :)

> Oh yes, one final thing, the ST comes/came with a VT-52 terminal emulator, is
> there anyway of getting a VT-100 emulator, so I can dump my old HP terminal.

ST Term is an old VT-100 emulator and Connect gives you that feature as
well. They should be on a FTP site somewhere. If you want a commerical
program, I strongly recommend STalker. Any questions you need, just ask
here... :)

Message-ID: <4kul92$6a7@columbia.acc.brad.ac.uk>
Source record: 147100

Phil Hough (phil4@phil4.demon.co.uk) wrote:
: Form (sic) what I've seen Thing V1 is totally useless for english users....
: because they can't get it.

Bzzt, thanks for playing, Thing Pre-release Version 1.x is only
available in German... To say "[English users] can't get it" is
misleading at best...

: AFAIK Joe Connor Supplies the English version of Thing V1, but ONLY to
: people who have registered 0.59.

Joe Connor does indeed supply an English verion of Pre-Release Thing
Version 1.00 to those who register Thing, where you get the idea that
it must be for registering Thing version 0.59 I don't know. I
registered Thing Version 1.00, I haven't used Thing 0.59...

: This is sort of wierd if you ask me !!! Why would anybody register an
: old version of a program, when a newer one is available, and why would
: people register a program, when they can't even try it ???

As I say you don't register version 0.59, when I registered Thing it
was on the basis of trying pre-release 1.00.

: If it is illegal for us to translate and use Thing V1 then so be it,
: but I doubt you'll get many people registering at all.... after all
: why should anyone register shareware when they have never tried it ???

What is illegal and troubles me most in this case is that the
translator did not get permission from the author, nor did she even
attempt go get such permission. In any event the point is that an
English version (_including_ documentation) of Thing Version 1.00 will
be available and released when the author wishes/is able to...

In case there is any doubt, I mailed Joe Connor (of InterActive - the
English Distributors of Thing) :-

To: J.J.Troup@comp.brad.ac.uk
Subject: Re: Status of Thing

In-Reply-To: <Pine.SOL.3.91.960415112213.16423A-100000@dcsun4.comp.brad.ac.uk>

Hi James,

> There has been been some confusion over the status of Thing and I was
>wondering you could clear up/confirm some things for me? (I need to know
>the facts so I can shout at certain people on c.s.a :)

I've already clarified my thoughts to Katherine Ellis by email and she has
taken on board my comments and AIUI is awaiting a reply from Alexander
before doing anything with her release.

>Thing Pre-Release Version 1.00 is only available in German
>Thing Pre-Release Version 1.00 in English is available to registered users

The English pre-release v1.0beta is Shareware and comes complete with
English RSC and help files and is currently only available to registered
users. Anyone who registers with InterActive receives the English v1.0beta
on a registered user only Master disk along with registration letter. The
current freely available English release is still v0.59e.

>And will an English version become available once thing has moved on from
>Pre-Release version? (i.e. generally available, even to those who have yet to
>register?)

Yes, the unregistered English release of Thing v1.0x will be uploaded far
and wide as soon as it's ready. It's beyond my control :-(

Please feel free to post this anywhere and here's my latest blurb for good
measure...

```
==========================================================================
InterActive supported software scheme 13th April 1996
--------------------------------------------------------------------------
About the scheme
----------------
```

The supported Shareware scheme was started by Joe Connor in 1993 to
encourage authors to produce and support English language versions of
their software AND to encourage UK users to register 'foreign' software.
Recently the scheme was re-launched as InterActive. With currently over
1200 registrations the scheme has established the proven benefits of local
support, which include:

- Key to remove features reserved for registered users available
- Local telephone, post and Email support
- Free update service
- No hassle handling foreign currency
- Labelled Master disk and registration letter
- ST-Guide on-line hypertext help (some software)
- Other software (dependent on disk space)

Registration fees are set to cover the currency handling, stationary,
media and postage costs incurred in mailing out master disks and providing
support.
Although primarily a UK support scheme everyone is welcome to register via
InterActive as an alternative to registering directly with the author/s.

The currently supported software is:

Version Software Fee Status and description
---
v1.73e Kandinsky 16 [S] Vector art using GDOS/Speedo/NVDI3
v2.03e Kandinsky 2 30 [S] Upgrade from v1.73 costs 16 Sterling

==========

How to register from inside the UK
---
1) Use the included ORDER_FM.TXT to select the required software
2) Make sure your name and address is included and *legible*!
3) Make cheques/POs payable to InterActive for the total amount
4) Send the completed order form and payment to InterActive

Additionally from outside the UK

- Add £1 to your order total to cover postage
- Make certain payment is *in Sterling* drawn on a *UK* bank address
The following methods are known to work:
-Bank draft/cheque
-Eurocheque
-International Post Office cheque payable *in Sterling*
-Cash! Sterling, Dollars and DMs are fine -but at your own risk!

Update service

New releases are featured in the Public Arena pages of Atari World.
Subscription details available on request.

By post

To receive an update send a self addressed envelope including return
postage (or IRC) and an unlabelled double sided floppy disk. Please state
clearly:

1) The software you'd like updated
2) The version you're currently using

How long will I have to wait?

Due to the number of people taking advantage of the service I can't always
reply as quickly as I'd like to. Often I'm waiting for a new version or
simply too busy earning a living so please be patient!

If you have Internet access

You can obtain the latest English language releases via anonymous ftp,
www, gopher, telnet or batch ftp from:

micros.hensa.ac.uk
URL: http://micros.hensa.ac.uk/
Path on hensa: micros/atari/tos/...

The Atari area on hensa produces a newsletter containing details of the
latest files. If you would like to be added to the mailing list, or have
any other queries concerning hensa you can email Denesh Bhabuta at:

danny@micros.hensa.ac.uk

If you have a modem but no ftp access

You can obtain the latest English language releases from 42BBS:

SysOp: Colin Fisher-McAllum
Telephone: UK+(0)1256 895106
System: 24 hour/28.8K modem/Falcon/8N1

Other Bulletin boards and ftp sites are allowed to carry the on-line
archives but because minor updates to the English language version are
sometimes made without changing the version number hensa and 42BBS are the
places to go to ensure you have the very latest versions!

Regards

Joe Connor

1027. FS: Gemulator 4.15 w/TOS 2.06

Newsgroup: comp.sys.atari.st
Date: 1996-04-15 00:00:00 UTC
From: ercorp@aol.com
Message-ID: <4kupd6$ebo@newsbf02.news.aol.com>
Source record: 147102

We are now selling the great Gemulator 4.15 w/TOS 2.06 roms for $179 plus freight. Connect to any ISA slot in your 486 or Pentium PC and run Atari TOS programs fast and efficiently. Great new price for the Springtime season.

Also selling complete Pentium 75MHz bundles with 14" Monitor and 8MB Ram, etc... starting at $1278.00 plus freight. These bundles include the Gemulator pre-installed and ready to go.

Check our WWW pages at:

http://www.godfather.com

See the Whats New section for our Pentium Blowout pricing and for specs on our Pentium 75MHz systems. Add the Gemulator package for only $179

Email me at: tj@godfather.com for more info.

>installed HSMODEM. When I do connect it it almost always at 28800 but is
>occasionally a little lower but never as low as 19200.
>I have both FPATCH2 and HSMODEM installed. Could there be a conflict here.
>The software is OASIS 1.35
>Any ideas anyone ?

This has nothing to do with the computer. The dialing starts after the
modem recieved the simple command ATD <tel-nr> <cr>
I use a Sportster 28800 with NOS at 57600 baud via Modem 2 on a Mega STe
without any problems at all. The modem is configured as when shipped.

There are however problems with certain Sportster modems produced before
Apr -95 if I remember correct. If you have an old modem you may contact
the dealer for exchange of ROM. This should be for free.

BTW, I remember you had difficulties with NOS and dynamic IP address.
I have found a setup that can handle both dynamic hostname and server names
without the need for numeric addresses. If you still have problems with
this maybe I can help.

From: ercorp@aol.com
Message-ID: <4kv19b$hlm@newsbf02.news.aol.com>
Source record: 147104

Can the Lan 8pin Din connector on the TT030 be used to connect a Spectre GCR TT030 to a Mac local talk network. The cabling is the same so I wonder if the Spectre GCR 3.0 has this built in to use the port to connect local talk devices like printers, etc... to the network.

Hello Atarians,

I wonder if anyone could help my friend and I. My friend is disabled and living on a low income. He would like to get a computer to get access to the Internet. I believe he would benefit from access to the Internet. Here in Milwaukee we have a provider who gives free email and Usenet News. I am wondering if anyone has an Atari system they would like to donate to my friend. I have an extra monitor and an extra modem that I'll contribute. I need a computer and floppy disk drive to complete the system for him. If you wish to verify that this will go to a disabled person then write to me and I will put you in touch with a supervisor of the support and therapy program that he attends. I wish to make it clear that this support program is not a charity nor is it a not-for-profit organization.
Thank you for any help you can offer.

[] Have you had this problem? Thanks , Raymond.

I seem to have had a similar problem with Demon, whether using a pc or my TT030. It would get to the logon sequence and hang 90% of the time. When it decided to logon, all was well but most of the time it wouldn't, though I don't use pop3 email so i can't speak about antmail.

Looking through a trumpet winsock script I found a place to add an extra carriage return before the logon sequence and this solved the pc problem. When I eventually found a way of adding a carriage return to the STiK script, that also solved the problem and both machines, all other things being equal, now log on automatically first time with no fuss or bother.

I added the following sequence to my dial.scr for demon:

FIND =
RESP = /

just before the 'FIND = logon:' bit but after the phone has connected... presumably '/' is a carriage return in STiK? I can't remember which STiK script i found it in but originally there was a 'WAIT = ' command before the above which may be useful with some

service providers.

What i don't understand is why no-one else on Demon appears to need the same technique...

Has anybody else had the same problem and used this solution?

I have also noticed that, even when the above works, Demon seems to hang quite often. If I hear the line ring once then I tend to be able to logon ok, but if i don't hear it ring before the modem picks it up or it rings two or more times then everythng seems to stall...

Strange - I used the demo version of Outside one or twice, and the desktop
showed the extra memory. Still, if it works the same as 'alternate RAM', as in
the TT, I'll be happy - TT owners with extra RAM seem happy enough...

Thanks for the reply.

Not that I know of. The Speedo format is more complex than the CFN format
and the common version is also encrypted (very well). I had a go at a
program that does the reverse using Speedo GDOS get_outline() functions to
spill the beans on the glyphs, but I am not very happy with it.

I wrote a little program called listfont that searches through a folder and
its sub-folders for font files and generates a text listing of the file
name and font name and location.

It can handle TTF, CFN, PFA, PFB, LAC, DMF, FNT, GSF & CG font types.

Useful for CD Roms.

Hi Guy! Erm, yes, I did run the setup program but it kept failing me, telling me it couldn't find various files so I gave up. Sorry. I'll try it again and get back to you. Do I need to do any shuffling around of files/folders or make sure anything is in a root directory?

I'll have a fiddle and see if I get it working.

More later!

Thanks for your help.

bdc2@po.CWRU.Edu (Boris D. Cahan) said:-

[]I am going nuts. From the description in the half German,
[] half English docs, it SEEMS that the TT with hsmoda is capable
[] of HIGHER than 19.2 KBd. Is this really true and HOW,
[] for God's sake does one do it.□????

I've got up to 57,600 with a 14,400 TKR faxmodem on my unmodified TT030 running STiK and connecting via Demon.

Running a default configuration of drivin.prg and scc.prg (without having to use the setter program that comes with hsmodA06), Litstport.tos (from www130.zip) shows a maximum speed of 153,600 for modem 2 and 230,400 for serial 2.

A variety of other speeds are available including 115,200 on Serial 2 which, i think, is the speed Demon run their 28,800 modems.

After running mfp.prg, listport.tos shows a maximum possible speed of 115,200 on modem 1. Running mfp_tt.prg shows a maximum of 115,200 on serial 1.

I tend to use serial 2 to run the modem and set xcontrol's modem.cpx 'Serial Port: Serial 2' setting to 110 baud for 38,400 or 134 for 57,600. Faster modems can use 150 for a speed of 115,200.

The STiK dialer script uses the proper baud rate not the hsmodem/xcontrol one!

I seriously considered the 540, but in the end my Father has opted for the
600c, which appears to do all that is required. The 600c was on very
special offer locally, and was quite a bargain buy!

Thanks for the advice, I think most people reckon the HP series are the
best suited to Atari, mainly because of the wide availability of drivers,
even though many are for the Deskjet 500 series!

In my experience with Outside the desktop does show all the RAM,
ST and Alternate (TT-RAM), combined.
Other progs, such as CPXs, sometimes see Virtual RAM as either more
ST-RAM or as seperate TT-RAM.

I will be getting an accelerator for my Falcon soon with TT-RAM on
board and I would hope that the computer and most progs use it as
though it were just more RAM. Though I do know of a few progs that
won't use the TT-RAM at all.

>I have a friend with a 4 MB Falcon 4.04. When he runs Apex on a VGA
>monitor, Apex tends to crash when calling the file selector. This
>don't happens when he runs in RGB. Any suggestions?
[clipped]

I normally use Apex in VGA mode and have had this happen a few times.
A reset usually fixes it. If it continues try using a different
desktop resolution, because the file selector appears in the desktop
res.

I have run a few tests. The problem is running the desktop in 4
colours. Every time the file selector is called the screen goes
black a nothing more can be done.
So just tell your friend to use either a 2 or 16 colour desktop.
2 colours, obviously, uses less memory but Apex messes up the file
selector screen, and the desktop on returning to it, but not by
enough to make it unusable.

Hope that helps.

Rich.

There used to be some older net solutions using the midi ports.
Perhaps you should look into those if speed is not a paramount issue.

1051. TT High Res.

Newsgroup: comp.sys.atari.st

1053. TT030 LAN port stuck at 19k2 - help!

Newsgroup: comp.sys.atari.st
Date: 1996-04-16 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <4l1a8e$6eo@status.gen.nz>
Source record: 146978

I am having trouble with my serial ports on my TT030 at speeds >19k2, and I see that you use this system with no trouble. Please tell me what you think is wrong with my setup.

I want to connect my TT030 and Mega STE via the LAN port.
I understand that I can get 115k2 via the LAN port of the TT030 and the Mega STE.

To start with, I had no HSModem or other serial patches installed. I ran CoNnect on both machines (this is the only terminal software I can find which supports higher speeds than 19k2) and configured CoNnect to use the LAN port. I found, however, that CoNnect would only set the LAN port to speeds <=19k2.

I then tried writing my own utility to set the ports speeds. I first used the method documented in the Atari Compendium (Offgibit(0x7F)) to switch to the LAN connector. So far so good, but when I used Fcntl() (I am running MiNT all the time) to set the baud rate, the /dev/serial2 device would not go over 19k2. In fact, not modem1, modem2, serial1 or serial2 would go over 19k2!

After this, I tried out HSModem (I think I may have an old version, though) and this seemed to improve things. The LAN port was still limited to 19k2 from in CoNnect, but using Fcntl() I was able to set it successfuly to 115k2. I did not try transferring data over the LAN port after doing this, but I suspect that it woudl have worked. The catch is that Mouse 2.3, the serial mouse driver, crashes with a Bus error when HSModem is running.

Next, I tried Fast_ser as supplied with CoNnect. The serial mouse still operated, and CoNnect would now set the LAN port up to 115k2. Perfect, you might think, but unfortunately this was not the case. Using Fcntl(), all the ports were once again limited to 19k2. Although I could just use CoNnect to set the port speed, I do not wantto have to load CoNnect all the time just to set the speed - especially when I need to set the speed before GEM is loaded!

So, at present I am stuck with 19k2, which is unusable for my needs.

I hope somebody can offer some suggestions, even if you think it is unlikely, any thoughts at all on the matter would be much appreciated!

The signals are not the same for your 'PC' monitor and that of an Atari TT High monitor. I know of no way to use a 'PC' monitor on a TT in TT High. However, you can use the other 5 Resolutions. The TT can put out 640x480x16 colors max on your monitor.

Hope this helps.

Heigh Ho

First of, thanks to John and Robert for e-mailing me to explain the
current ST scene. Nice to know the war continues, though when I were last
around it was ST v Amiga and the PC was a laughable contender :)

Nowadays it's all UNIX and MS-Windows where I am :)

Anyway I digress.

I managed to lay my hands on some 30 pin PC SIMMs, the ones I had had were
72 pin which was where the first confusion arose. Now for the second confusion.
The SIMMs in my STE have 30 pins on them, the SIMM's from the PC end in a
30 way edge connector. Do I just need to solder 4 x 30 pins onto the SIMMs
or do I still have the wrong type of SIMM?

Were you refering to XBIOS calls where you read and set the
resolution modes for mainly TOS programs? I only know 0 to 2. The
ST can switch them and use them for the VT52. GEM itself doesn't
even know about the toggle.

My concern is with does the Falcon, TT, or Gemulator have any extra
XBIOS modes other than the three for the ST?

1071. Mega STe ram upgrade

Newsgroup: comp.sys.atari.st
Date: 1996-04-16 00:00:00 UTC
From: Frank_Szymanski@do2.maus.ruhr.de
Message-ID: <199604160025.a64227@do2.maus.de>
Source record: 146996

HS> f> Have someone upgrade ram on Mega STe from 4 to 8 or more Mb ?
HS> f> Thank a lot to everyone can inform me about the above .

HS>Unfortunately, no. B^{<

That's wrong. There are three ways to upgrade a Mega STE to more than 4megs.

1) PAK with FRAK (Prozessor Austausch Karte [processor replacement card] with Fast Ram Karte [Fastram card]) (TT-RAM up to 16megs)
2) multiboard (where you can also insert a graphics card) (Alternate RAM)
3) a special board from a german guy (ST-Ram up to 12megs)

All of these ramboards have one great disadvantage -> the price.

Tschuess Frank

> 300 bauds or so..:(Any help will be appreciated!

No, you can't. The multi-function-peripheral-chip used for baud-rate
generation can't do more than 19200 as long as the baud-rate is
generated via the inside timer.
You can either use the hardware patch RSVE or simply fix the baudrate
to 38400/57600 using an extra 74AC|HC74 as I did last week :-)
I don't have to switch the baud rate because most modems work with
automatic baud-rate adjustment.
I "transferred" my ST into a PC-box wich is quite easy to open. Then
I put the 74nn74 on top of the MFP soldered 4 wires to it, and
connected it to the RxTx-CLK input via a switch. The switch is just
in case I need a different baudrate :-)

For some reason I didn't receive Andreas' posting so I'll use the above quote...

I have seen an accessory that can start programs (I'm thinking of 'One_Jack' and others of that ilk
and Guy suggests that a CLI acc. does/did exist somewhere.

So what's the deal? CAN a console be run reliably forom an acc. with TOS 1.0 or not?

Guy , do you remember the name of the old CLI or where it came from? If I can look at some code I may be able to do something with it...

I'm not planning to multitask yet - I've only recently acquired my STf (*gasp*) and I'm keen to see how far I can stretch the little darlin' before upgrading!

Andrew.

a> Demon in the UK!

Not so, Andrew. POP-3 is a client-oriented protocol; SMTP is the Internet standard for SENDING email. In point of fact, when you send mail using SMTP, it's going to the destination more-or-less immediately. POP is your mail reader telling the mail server, "hey, I'm here, send my mail on down!"

>installed HSMODEM. When I do connect it it almost always at 28800 but is
>occasionally a little lower but never as low as 19200.
>I have both FPATCH2 and HSMODEM installed. Could there be a conflict here.
>The software is OASIS 1.35
>Any ideas anyone ?

I'd be more inclined to look at the hardware settings of the modem itself
look in the S register section under carrier or conect wait time..if its
set to low and it takes one or 2 rings too long it will cut out and start
all over again because the handshake sequence went over the S register
wait time
on my modem the S9 register is carrier detect responce time
S7 is the wait time for remote charecter
I recall having a similar problem and made the S9 register a little longer
I think the string is ats7= (anything from 0-255)
but your user manual can tell you the exact procedure

also..ask your sysop what the speed range of the modems they use are..it
may be that the modem you are conecting to is cause of the diferent
speeds when conected...obviously if its a 19.200 then your modem conects
at the same speed....hope this helped a bit...mail me if ya need anymore
help on the S register settings....:)

NONE!

The MiNT plip is not the same as Linux plip. The problem is that the
Atari ST computers don't have a fully equiped parallell port, therefor
the MiNT net plip was made a bit different then the PC (linux) plip.

Message-ID: <4f7cc$1513f.19b@goldengate>
Source record: 147020
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I recently placed a Kanji Font (.cfn) on my home page because someone here was looking for one. It dawned on me that I have almost 4M of SW fonts on my HD that I downloaded back in the days that I had a GEnie account. The collection includes Hebrew, Russian, Japanese, display, bats, typefaces, and such arcane things as music notation, Barcodes, and the I ching.
I was wondering if anyone would be interested having a look at these as well. Let me know here if anyone would like them. The space on my server is limited so I can't ul them all at once, I'd probally have to break them up into a few individual zip files. Sort of a Gregor's CFN package of the week.
If I were to do this, I'd like to create an index file. Does anyone know of an app that would allow be to read the contents of a folder and export it as a .txt file and where to locate it?
Let me know...

From: 213274@msn.com
Message-ID: <00001bdd+000040de@msn.com>
Source record: 147021

Ross-

I was thinking of buying Calamus for Win '95 to do my desktop publishing on. I have been using Pagemaker 6.0 but don't like it. Too fussy and the interface has too many things scattered all over the place.

Calamus seems to be more organized and have more capability in terms of photo editing and WYSWYG. I have a non-post script printer. Is this a problem? And does Calamus import lots of graphic formats such as Corel Gallery clipart?

A prompt response would be deeply appreciated.

Brian

From: smiller@farad.elee.calpoly.edu
Message-ID: <4kuvr5$phc@isnews.csc.calpoly.edu>
Source record: 147023

Ok, I downloaded WWW130 and five minutes later had it working. I found no problems with it except for Jpegs which has been covered. BTW is this a new record or what for setup time. I do pretty much bypass the entire logon feature in the program as I didn't get it to work last time, so I didn't mess with it this time.
Everything works fine, but now I need a 28.8 modem :(and a hardware mod to allow my TT to work with it...

Telnet does not work.

It will login to the site and tell me that I am connected, but the prompts never come up asking for the login and password. I tried it on two SEPERATE systems/accounts I have and neither worked. One is a DEC cluster and the other is an IBM/AIX cluster.

What's the deal?

Thanks,

*steve

If you are using a hard disk driver that supports the SCSI WRITE AND VERIFY command (HDDRIVER does, but you need a TT/Falcon or an ICD adapter to have access to this SCSI opcode) the loss of speed is 50%.

There was an article in ST world (Long ago !!) about a travel agent in the
UK who had linked Atari's. I think they used something called SDS Net,
which was a cartridge port adapter.

The speeds were fairly good, but the cost is high .

It is possible to conect an ethernet adapter to an atari, but the cost is
high also.

Well, this sounds like an overrun keyboard-buffer which rapidly sends
ESC-keys causing your windows to be updated pauseless. Try to move the
mouse into the menu bar and select "New Folder" or some other dialog
with an edit field in it. You see the edit cursor blink. Press any key
and wait for the edit cursor to remain still. Abort the dialog, and
everything should be OK.

Ciao

#>If I disable the Autoboot and start the programme using a function key I don't
#>have the same problem. By the way this problem is not specific to any
#>particular prg.
That's a well-known problem with XControl and probably some other accessories which allocate memory and have a long initialisation time.

You may know that all memory allocated by accessories belong to the current running application, not to the accessory itself (this is with SingleTOS). Usually, when an accessory like XControl starts up, the desktop is running, so the memory belongs to the desktop, which doesn't exit.

The situation changes when you use an autoboot-application: It runs before XControl has finished initialisation, so some of the memory allocated by it belongs to the autoboot-application. When this application exits, the memory will be freed. Unfortunately, this block is very important for XControl and gets overwritten really soon because it is now free memory again! The result is a crash whenever you try to load a CPX-module.

I've written a little program for Thing that solves this problem. It is installed as the autoboot-application instead of Thing and uses a special way to keep all memory that was allocated when it was running, including that by XControl. It waits for a specific time and then runs Thing.

If there's interest, I could make a more general version of this utility allowing to use it for any application, not just for Thing.

There's no other way to get rid of the problem if you don't want to either drop XControl or the autoboot-application.

#>have just "lost" their windows.
#>
#>A wild shot in the dark - maybe the same happens under TOS but it
#>crashes instead?
I guess not. Take a look at your magx.inf file. There should be a line beginning with #_TSL. This line normally activates preemptive multitasking as soon as the auto folder is finished. So all programs in the autorun-folder of MagiC will run in parallel. It might then happen that one of the applications issues a Malloc-call while another one has just been loaded and not yet freed all unnecessary memory, so that the Malloc call fails, leading to sometimes serious problems. Without this line, MagiC will only multitask in cooperative mode, so their won't be any task switch before an application uses the first AES call, solving the above mentioned problem.

Of course, you don't want to use cooperative mode afterwards, so you have to use the TSLICE.CPX that's on the installtion disk (it's not installed auto-matically). Activate preemptive multitasking in it and save parameters.

So, simply remove the #_TSL-line in your magx.inf and install TSLICE.CPX with preemptive multitasking switched on. That should cure your problems.

I have a MegaSTe with 10 MB, thus it is possible (and it works fine
with almost all programs; only a few require to boot with 4 MB or
to install a ramdisk with 6 MB).
Since it was used, i do not know how the anhancement was made; as far
as I remember, the serial-2 port is removed.
If you are interested, I can check out details.

You've probably been deluged with replies, but the easiest way to deal with the First Word+ files is to use a little utility I recently acquired entitled WPLS2RTF which produces very good RTF files from Word Plus documents.

If you can't find it I'll attempt to binmail it (although I wouldn't hold your breath - I've only just managed to acquire access to usenet, so binmail might be beyond me, but I'd give it a go!).

The system checks if you have a blitter on your machine. Not all have
one. If I recall only 520/1040 STs, STFs and STFMs didn't have a blitter
chip. Mega STs, 520/1040 STEs, Mega STE, TTs and Falcons all had one.

I never noticed the difference anyway.

Matt Mathis wrote:

> o Is parity an issue when using an ICD AdSCSI+ as the host?

Well, I don't know about the ICD drivers, but on Falcon you should turn parity off (that's what I had to do!). When one uses parity on his SCSI bus, all units need to have it enabled (including the host adapter).

> o About "termination power": What is it, which end [drive or
> computer] supplies it, and do I WANT it or NOT WANT it? Is it
> configurable in some way as parity sometimes is/was? [That is, is
> there a workaround--not involving soldering irons--if I find myself
> with the "wrong" drive?]

Both ends of the bus should be terminated (that is, in a "single ended" configuration). On the Falcon (and propably also on the ICD host adapter) one end of the SCSI bus is already terminated internally in the adapter. The other end of the bus needs to be terminated somehow.

There are several ways of terminating a SCSI bus:

o The last unit is terminated itself. Newer SCSI units (newer than approx. 2 years) can be terminated with either a jumper (for internal units or a dip switch (for external units))

o The end of the bus is terminated by a hardware terminator. These terminators can be bought in most coputer hardware stores and range in price from cheap ($10) to very expensive ($200) depending on weither you want passive or active terminators and the quality.

Some words about passive resp. active terminators:
A passive terminator is as simple as a resies of resistors at the end of the bus, i.e. it takes its power from the bus itself. An active terminator has its own power source and is thereby less sensitive to external influence on the bus (for example bad hardware). A good active terminator can actually impove SCSI perfomance because of less resends of corrpted data, so it might be well worth the price to buy a good one. I know very little about the quality of the terminators that is enabled by jumpers/dip switches on the units themselves.

> o How can I phrase inquiries based on the above items to drooling
> klone-damaged salesnerds without appearing an idiot in need of

> been terribly illuminating in this respect.

I have used Seagate drives for quite some time with very few problems. If you have the cash, go for the high-end "Barracuda" series that are very fast. Otherwise buy the less expensive (but still pretty good) "Hawk" drives. You should avoid the cheapest series (I unfortunately don't remember the name right now) though beacuse they are of very low quality and are very slow (by looking at them one suspects that they are re-build IDE-drives).

>speakers, so those tracks in 1&4 in the mod file ONLY go to the left
>and 2&3 ONLY go to the right... NO OVERLAP !!! and this leaves music
>sounding VERY cr*p through headphones.

I know exactly what you mean. It's very strange having sounds panned hard left or hard right, but fortunately my stereo (into which my STE is connected) has three different sound modes: mono, stereo and wide. The latter option makes all the difference when listening to MODs through headphones: a little of the signal from each of the channels is `leaked' onto the other, giving the sound a more natural feel.

>I have 1 mod player that attempts mono and stereo, called 'The
>Jukebox' its a DA and works... sort of.

It works, period!

>Unfortuanatly the routines used in the player just aren't fast
>enough.... even on my MegaSTE with a 16Mhz CPU, It can't do anything
>more than use its fastest routine (=lowest quality) at 50Khz, the
>other two options... Interpolated Mono and Mono Good s/n won't even
>work at 25Khz.

Try BackTrack, which comes with ProTracker ST. It has a multiplex replay routine which will allow a MEGA STE to play at 50kHz quite comfortably. It only takes as much CPU time as a normal routine would for 25kHz! If you have NVDI installed too, the whole thing doesn't kill your system (although I'd advise switching off the BLiTTER when using BackTrack, since it'll hog the bus time and ruin the sound when you do something heavy, but with NVDI you don't need it anyway)

>What I'm praying for is people like Griff who wrote the ProTracker
>Replay 50Khz, to perhaps ammend his code one more time, and add a mono

>option ??? then we get the excellent quality his mod player
>provides... even when used with headphones.

Is this the simple commandline based program? I seem to recall that this used
a normal mixing algorithm, which while providing excellent 50kHz quality, took
an awful lot of CPU time and didn't allow anything else to happen simultaneously.

I would imagine that a mono replay routine would reduce the sound quality, because
the sound chips (DACs) have a finite resolution and since the same sound needs to be
reproduced on both channels, you are having to squeeze four voices into each channel
rather than two, i.e. you have less bits to represent each voice.

Anyway, I would never use mono mode on my STE when so many (including some of
my own) modules have stereo effects. Use loudspeakers, or get a cheap mixer!
If you *really* want mono then there's a simpler solution: get a mono-to-mono
headphone extension/plug. This will automatically make your STE's output become
stereophonically challenged.

A little more about the ST-->PC question:

The best way to guarantee compatibility, if the ST in question doesn't format floppies that can be read on the PC (like Guy said, try it first.. you may luck out) is to format a new floppy ON THE PC, then use that floppy to transfer the files from the ST.

Be sure to format the disks as LOW DENSITY, 720K floppies as the ST cannot use High Density 1.44Meg disks.

There is also a PC program called ST2PC that will allow a PC to read the files from a standard formatted ST disk, but it might be a little hard to locate.

Questions..!

1- Yes.. PC SIMMs work just fine in an STe.

2- Essentially NO.. IDE hard drives won't work with an ST. There's supposed to be an IDE interface available "from Germany", but if you see one, check to see if you're awake.

3- Yes.. retrofit kits are available with far better versions of TOS (2.06) check with a dealer like Toad Computers in Severna Park, Maryland (whose phone number I unfortunately don't have with me).

4- I don't believe a standard VGA monitor will work with an ST.

5- Atari is essentially out of the business. They completely dropped their computer line years ago, and have until recently been making the Jaguar video game system. They merged with a disk drive manufacturer called JTS, and reportedly are looking for a buyer for their video game assets.

Also... the STe hard drive interface is *almost* SCSI, but not quite.

You need a "host adapter" board to convert the signals from the ST to SCSI. These are available (~$100) from ICD, Inc. (Toad Computers sell them too).

Lastly, the very early samples of the 1040STe had a "flaky" DMA chip in them that can cause problems with a hard drive system. If your system is one of the ones affected, you can probably get a replacement from Best Electronics in California (sorry I'm at work and don't have any of the phone numbers available...!)

Yes I must have missed that one,or perhaps it went into that Demon
black hole again :-)

Anyway tried to get the new version of CAB from Alexanders page but
after receiving only 60K after about ten minutes I gave up. The modem
just sat there doing nothing,wrong time or something :-(

Unfortunately I think it is :-(

I never saw your suggestion, and I take my news every day, sometimes twice!
Mind you, some of my postings don't appear either!

Anyway, many thanks for your suggestion, it will be acted upon!

Roger Burrows (ExtenDOS) also kindly sent me the massive list of CDs which
are known to contain at least 75 percent of material that Atari owners can
use directly.

I've not actually seen any mention of the 'QwikForms' CD before - any more
info?

Zgadzam sie,you're right, though by careful mapping I can have French,
German, Polish, Hungarian,and Turkish at the same time. Apart from Dutch,
that will be fine for me. Papyrus 4 [.09 onwards] will let me use all 564
characters in the same text. AFAIK only the German version is available by
now, rumours have that the English version will be ready in summer [who's
working on that?], Tom Thomason is working hard on the Swedish version, and
I'm translating the Dutch.

1119. Converting the CX-80 Trakball to an ST Mouse

Newsgroup: comp.sys.atari.st
Date: 1996-04-17 00:00:00 UTC
From: starship@3rdplanet.com
Message-ID: <4l33n7$o3h@ratty.wolfe.net>
Source record: 146657

Considering the size, maybe that should be "moose..." <G>

Anyhow...
Someone asked how this is done, and since I'm very bad at keeping
track of who's who, I'll make it public.

This is a simple project. You need:

CX-80 Trakball
9-pin Mouse cable
soldering iron (30 watt or smaller, needle point)
fine 60/40 rosin-core solder
small Phillips screwdriver
Pinout for the mouse port (look in your ST/STe/TT/Falcon manual, or
check the STiK home page for the html version)
A continuity checker (flashlight battery and low-voltage bulb) or
ohmmeter
Small needle-nose pliers or large tweezers

Steps:

(1) Pry the rubber feet off your CX-80. The screws are in recesses
under the feet. Unscrew the body halves.

(2) Remove the top of the CX-80 case and set it, the screws, the feet,
and the billiard ball aside. Remove the trakball cable and throw it
away.

(3) Identify the wires on the mouse cable. You need left button/right
button/+5v/ground/XA/XB/YA/YB and there's one left over.

(4) locate and remove the wire that connects the left and right button
pads on the CX-80 circuit board.

(5) solder the +5v and ground leads from the mouse cable to the
correct places on the CX-80 circuit board. They'll be on the edge
connector.

(6) solder the left and right button wires to the correct spots on the
CX-80 board. These will be near the button pads themselves, rather
than on the edge connector.

(7) Holding the CX-80 with the edge connector at the top, there is an
IC in the lower right corner. Make sure your power connections are
right and plug the mouse cable into your ST. Watching the mouse
pointer, put the XA wire on one of the middle leads of the IC amd move
the rollers. When the mouse moves in the expected direction,
tack-solder the wire in place.

(8) Repeat step 7 for the other 3 directional wires.

(9) Stick it all back together and enjoy!

1122. www130:an OLD? forms problem??

Newsgroup: comp.sys.atari.st
Date: 1996-04-17 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <4l367p$4ob@madeline.INS.CWRU.Edu>
Source record: 146756

I am one of the few lucky? people who never had many problems
with STiK/Cab almost from the beginning. I now have www130
with the Cab 1.2, and it works great! Until now. There is a
host on the web called Switchboard, where one can get Phone nos.
Anywhere in the states for anyone or for any business. Its great!
I first found it with my (ugh) PC at the lab, in Netscape.
One has to register with a FORM, get a password sent to your E-mail
address, and then LOGIN. From that point, you can find phone nos.
for anyone, anywhere.
With CAB, I can get the intro page, etc. and then the
LOGIN page, and the form on which one enters his e-mail address
and a password... When I hit "LOGIN", after entering the right values
on the form, it connects, gets data, and then hangs at
PRECISELY 2646 bytes received. Over and over again.
Now I seem to recall that there were some others in csas
who also had problems with long forms. I didn't pay
attention, cause MY setup worked fine. But I thought that I read
that the problem was solved? Am I right? or wrong?
Anyone interested in trying same, if you have an e-mail
access, can find Switchboard with LYCOS or Yahoo or savvysearch, etc.
Is this an old problem, still unsolved, or am I going
nuts??
Boris D. Cahan

>Hi every one!
> Is it possible that CAF can play midi, while it play samples?
>I mean, like a soundtracker, not direct to disk.

If I understand CAF correctly, it cannot do soundtracker style sample playback. However, it does playback midi at the same time as the d2d samples...

Breakthru/Sequencer One both do what you want, but S.O. certainly doesn't like the Falcon, and IIRC Breakthru was never modified to use the Falcons sampling hardware...

>I seriously recommend Edith, it's the perfect editor that's barely
>short of being a word processor. You can use it as an acessory so it
>should meet your needs. ,

This is the problem that I've found with many text-editors (QED,Edith...)
- they are trying to be Word Processors, not text-editors. I need a
small (ie. I can keep it running while compiling with GCC) program that
doesn't do lots of flash Speedo fonts, word-wrapping and the like -
I just want an editor, with search/replace, and a few other useful
functions like that...

>Another one you can check out is SprirtEd which I got off a STF disk.

Yes, I like this - except:
1) it puts those annoying CR characters at the end of each line.
2) it always word-wraps - this makes my unreadably long lines of
C even harder to read! :-)

Anyway... anyone know a good EDITOR - not a word-processor-like-thing...

Anthony

Message-ID: <Dq0LHn.C69@cf.ac.uk>
Source record: 146760

The problem isn't software, it's the monitor your using. The TT HI output isn't VGA but ECL, there's a separate pin on the D-socket for it, plus a pin which must be taken hi (or low?) to make the TT boot into TT high, just like the ST's with the ST high mono monitors.
You'll need an ECL input monitor, I use the 21" Eizo 6500, I'm afraid though that there ain't many others around. Maybe someone knows how to convert ECL into RGB signals?

That fits my problem exactly, especially as half the programs which
autoexecute are my own which I know are very Malloc() intensive. It
never occurred to me because all of them issue alerts on failure.
These never appeared but if I've just remembered correctly, MagiC
needs memory for its alerts does it not?

>Without this line, MagiC will only multitask in cooperative mode, so

Yep, I've got that cpx to keep STiK from "sticking" (sic) :-))

>So, simply remove the #_TSL-line in your magx.inf and install TSLICE.CPX
>with preemptive multitasking switched on. That should cure your problems.

Thanks :-)

I've no idea about the ports on a TT so providing it makes sense to do
so, then editor.prg can be used to directly change the text for the
"SERIALPORT =" variable to whatever is required.

I normally use Superboot and I thought that was the problem. I then tested my
set up without Superboot and found the same result. Just to clarify my query:
I really am talking about the desktop auto run option for Gem prgs. i.e.
switch on the m/c and it boots straight into the required prg. After exiting
that prg back to the desktop and then trying to access a cpx module is when the
two bomb system crash occurs. If I boot up the m/c and after the desktop is on,
screen electing a prg by using a pre determined F key then there is no problem

: help would be greatly appreciated. BTW it's a 14" Dell SVGA monitor.

Atari, in their infinite wisdom, decided to make TT Hi incompatible with standard analog VGA monitors. You'll need a monitor that accepts ECL inputs. These aren't that hard to find, but unfortunately they seem to tend to be fixed frequency and fixed resolution. Which means that if you stumble across an old Sun ECL monitor for $50, it likely won't work :P. If you're not interested in searching for a monitor compatible with TT Hi, your best bet is a graphics card; someone was selling AlberTT cards (1024x768x16 colours) here for a reasonable price. The Nova cards appears to have decreased in price as well...

The one in the new CAB 1.2 package on Alexander's homepage and elsewhere,
silly!!

New CAB and a second OVL (sits alongside the standard OVL) which allows
inline JPEGs and has one or two bugfixes, including the picture printout
size one (but apparently not NVDI colour bug).

>Thanks for your help.

OK...here's my problem with the SETUP. All my files are in the WWW130 folder in
the root of drive I. I go into WWW and then into the SETUP folder, and click on
Setup.PRG. I then get a message saying ' Cannot open Resource' I:\setup.rsc '.
I copied setup.rsc into the root directory to see what would happen, and went
back to setup.prg. This time it gave me the language prompt. I selected English,
and then got the error message ' No setup data '. I then copied setup.dat to the
root (noting that pug.pos had been created) and tried again. This time after

having gone through the language selector I was confronted with the message ' No batchfiles ' and indeed, there were none. This time I wasn't sure how to progress so I didn't.

Am I missing something here? I've read all the docs to see, but I just don't seem to be able to make much progress.

Can anyone help? Guy?

Thanks!

Simon

: In article <4jug7p$r59@macondo.dmu.ac.uk>, c4sy@dmu.ac.uk (Simon Yardley) writes:
: >The Falcon is definetly better than all Amigas apart from the A4000/040 !
: >Its main asset is a beautiful DSP chip that is rated at 16 MIPS !
: >(Nearly as fast as the 68040 chip in the A4000 !)

: What does the A4000 manage? The CPU is 25Mhz, right? I've also heard that
: although
: it has a 32-bit system bus, it's clocked at 7.14MHz. Any truth in this?

The A4000/040 is 25MHz. However, there are expansion boards for A1200s with
both 40MHz and 50MHz 040. (So there may be a few A4000/040/50 or so.)

The CPU and blitter access chipmem at the same speed on all Amigas (7.14 MHz).
The new (AA) graphics modes are a bit strange though: the AA chipset features
some kind of burst reads which can make graphics DMA at least 2x faster.

: I guess the A4000 has higher resolutions and a larger palette. Only
: 8-bit/pixel though??

(Normal PAL TV:) Horiz 320/640/1280 pixels. Vertical 256 pixels (512 lace).
The 1280x256 gfx mode grabs 80-90% of the chipmem time :-(

Using copperscreens, it is possible to create a 320x256 12-bit truecolor mode
with pixelsize 3x3 (each pixel is 3x3 lores pixels).

Using HAM8 - one of the weirdest display modes known to man - and 640x256, it
is possible to achieve 18-bit truecolor with 2x1 pixelsize. It's a fairly new
technique mainly invented by Equalizer (or was it Offa?)/The Black Lotus some
time during the fall '95 and presented in 'Tint' at Gathering '96. By then,
some other people had been discussing the idea a month or two.

That's the whole point. A given service of an integrated system might
be more reliable and more predictable because required operating
assumptions are simpler.

That's why I would recommend that anyone who is serious about timing
to actually test any new system for themselves.

You conveniently left out that part.

>
>Sounds like "pro-Atari" FUD to me.

MIDI is one of the few areas in which the Atari has yet to be equaled.

You would probably be better served getting more RAM. SIMMS have
hit an all time low recently. If they are a viable upgrade option
you might want to look into them (16M,72pin=$250).

misc.forsale.computers.memory
would be a good place to start

VM unless well implemented most probably wont perform up to your
expectations wrt response time. It can turn a DX4/100 into a TI/99...

There is also a special mono-detect signal. It is present on the ST and
is probably present on the TT as well. Unless that signal is in the right
state...

Now proper sync rates are a different matter. You might want to make
sure that the monitor can handle them (both horizontal and vertical).

Otherwise, you can fry a monitor...

Three years ago I registered GEM-VIEW version 2.30. I sent in my money and was given a code that I should REALLY have written down!!!! Instead, I entered it in the program and didn't think twice about needing to remember it again someday. Well, after just recently aquiring a new version of GEM-VIEW (version 3.06), I am told that all I have to do is re-enter my old code/key and everything would work legitimately once again. Only thing is, I NO LONGER REMEMBER IT:-((((((If anyone can help with this I would be grateful forever. Thank you.

Sincerely,
Mark Anthony

This is slightly unusual, but you should be able to follow the same procedures as for the regular 16 chips. Your chips are four bits wide (256Kx4) so you have 4 instead of 16. You will need 4 more to get to 1 Meg. To get 2 Meg, you would have to piggy-back 8 more chips, although this is something that might lead to an unreliable ST.

You would be better off either purchasing a SIMM board like Marpets Xtra-RAM or else (if you have the skills) making up your own board if you have the RAM chips & other materials to hand.

Good Luck

1154. A few TT questions

Newsgroup: comp.sys.atari.st
Date: 1996-04-17 00:00:00 UTC
From: <>
Message-ID: <4l3rlp$nda@nw003.infi.net>
Source record: 146788

Please forgive a new TT owner (atari sale, yeah!) a few questions. I have a few ST's (Mega2, 2 520STM's) so I am not a rank beginner but the TT is a little new to me.

First off how functional is the Linux/68K port for the Atari TT? I have been using Intel Linux since version .12 so I am VERY familiar with Linux in general, just not the 68K version. Specifically I would like to connect my TT to an Intel based Linux box as an X-Terminal over a serial connection. Has anyone tried this and are all the necessary parts available?

Second, I have an Apple Laserwriter Plus with an Appletalk port, is that in anyway compitable with the LAN connector on the TT, This would be especially helpful if it worked under the MAC emulator, Spectre/GCR.

Third, this is a little strange, does the keyboard color on the "normal" TT match the case color? I seem to have a German keyboard, but one with a US layout. The labels on the back are in German and there is a big G in the corner of the Atari label. The computer itself is a US model and the keyboard works fine, it is just a darker gray color. It seems to match the floppy drive surround in color.

Thanks for any info and pointers on my newest "toy".

> SIMMs?

NO! TT ram is 32-bits wide, so all four SIMMs must be alike. I would
assume that a half filled bank will register as zero, or an error (which
then gets translated into "zero ram installed").

I don't have the genuine Atari fast ram card in my TT, as I bought my TT
Ram card from System Solutions a couple of years ago (RamTT? MegTT? I
don't recall the name for it, unfortunately), and currently have one bank
of 16MBytes in it)

> I'm guessing that TT RAM is regular 30-pin 8-bit (no parity) 70 ns
> SIMMs. Is that right? What is ST RAM? If I've got extra TT RAM SIMMs,
> can I stick them in as ST RAM (realizing that they won't be as fast)?

ST Ram (On ALL ataris - not just TTs) is only 16-bits wide, so you can
have two different banks of chips - the TT motherboard has one bank of 2
Megs, and you can fit either a 2 meg card, or an 8 meg card, giving a
total of either 2, 4, or 10 Mbytes (2+0, 2+2, 2+8) of ST RAM.

ST RAM on my TT is not able to use SIMMs - partly due to the hard drive
sitting on top of the RAM, partly due to the "chips on motherboard
preclude SIMMing" design.

> Also, while I'm on the subject, m68k linux will use both ST and TT RAM
> (transparently) just fine, right?

Sorry. Haven't seen/used linux - only read enough advocacy (in other
general computing newsgroups) to mind-numb a genius.

Would like to try it, though. (Linux that is, not mind-numbing a genius :))

Does the Monitor Master let you use a TV's VHF antenna-in and use the TV as a monitor? Is the video-out on the Monitor Master just video, or the video/audio signal for the antenna? The audio out is pretty self-explanitory.

How much is one of these worth?

Source record: 146800

ashort@mettav.demon.co.uk barked in U.COMP.SYS.ATARI.ST on Thu, 11 Apr 96:

s>> ... extract from STR #1213...
a>
s>> reporting Atari's sell-off of some warehouse stock but neglecting to
s>> report what was being sold and what the prices were.
a>
a> Are you sure that the press release that was printed in STR was actually
a> the same one that was posted on c.s.a.s?? It looked different IMHO...
a> not truncated. :|

I have both here. They are word-for-word the same, until the description
of items for sale begins. STR stops there.

s>> ... It can only be termed humourous by those who have a very sadistic
s>> sense of humour, and a deep-seated hatred for all things Atari:
a>
a> Oh please!!! Have you absolutely no sense of humour at all!??

Apparently not. I find no amusement value in reprinting old articles which
were intended primarily to subtly (or not-so-subtly) point out the lack of
sheepness amongst Atari users. Your mileage obviously varies. Bully for
you.

a> I have been an Atari fanatic for ten years and have closely followed the
a> development of the ST/E/Falcon and Jaguar. All of which had potential
a> mass appeal that was simply wasted by Atari's awful marketing strategy.
a> Also, look at the abysmal design errors and underused features on the
a> ST.... the non standard hard drive port, the positioning of the joystick
a> ports and the analogue joystick ports are just a few examples.

Yes, Atari used a cut-down SCSI interface for the DMA port. At the time
the ST was designed, hard drives were still very expensive. While the DMA
port didn't directly interface to anything until the Atari Laser printers
were released (BTW, the ONLY printers in the industry which ever printed an
honest 8 ppm from the time you hit "print"), it was very easy to implement
a full SCSI interface - the fastest and most versatile interface for hard
drives, plotters, scanners, and sundry other peripherals that existed then;
and even now SCSI is the interface of choice for large systems which need
speed and reliability. Yes, that was very short-sighted, wasn't it?

As for the joystick port placement - have you ever tried to plug in a
joystick, MIDI cables, and a serial mouse on the average PC? Which is
harder, moving a 15-kilo box (which often has the monitor atop it) to get
at the back panel (with an upside-down perspective most of the time), or
picking up the front of a 2-kilo keyboard unit?

Underused features? Atari designed hardware. Their software division was never more than a bad joke, except the OS department (and there's even a little debate about that). If the features weren't used, blame the software developers.

a> The article which you are complaining about merely highlights the same
a> problems with the Jaguar.... and proves that Atari never learnt from
a> their mistakes. IMHO the article was probably written by a dedicated
a> Atari fan who, like myself, believes that if you can't laugh at yourself
a> the what can you laugh at!?

It may have been. If it was, I'd wager he prefaced it with something SAYING it was humor written by a lover of Atari hardware (and a hater of the Tramiel marketing plan). We'll never find out from the STR reprint, though.

s>> For those of you who have never read ST Report, you have just had a
s>> taste of the sort of "impartial reporting" that is typical of ST
a>
a> Bollocks!!! This is absolute crap!! ST Report consists purely of
a> press releases, short news bulletins, PC Software reviews and hardware
a> guides and two small editorials.... one from Ralf and one from Dana.

Exactly. So you are now alleging that the "humor" article was which, a news release, or a review?

And please note that Ralph Mariano is the author of one of the two editorials. He's hardly known for honesty or impartiality.

a> These editorials are the only places in the magazine where a personal
a> view is expressed, and the only place where any "impartial reporting"
a> could possibly have the chance to take place. Due to it being an
a> editorial you should KNOW that it is simply the personal opinion of one
a> person and not something to be taken as the view of the whole magazine
a> team.

Obviously. But, if you are correct, the team has no control over the content, EXCEPT to choose what to include and what to leave out.

a> Personally I think both editorals make very enteraining reading...

Some people enjoy being spanked and urinated upon. Tastes vary.

s>> Rpeort and, indeed, any publication controlled by Ralph Mariano,
s>> world-famous Atari-hater and accused defrauder of many prospective
Atari
s>> purchasers. I say "accused" because the Florida State Attorney
s>> General has refused to prosecute; the vast majority of Ralphie's
s>> accusers are Europeans, and we all know how Europeans fare in
s>> Florida.
a>
a> Is this your reason for slagging off the whole magazine!!???

Isn't it enough? If Bill Gates were the publisher, would you trust STR to be honest or reliable? How about Saddam Hussein?

I judge STR by their track record. Raplhie is an additional, not the only, hindrance to trusting STR.

a> Ralf has nothing to do with the Atari side of STR.... that is all run by
a> Dana Jacobson, so don't let your personal anger toward Ralf cloud your
a> judgement of what is an excellent publication.

Raplh is the publisher. He controls what is published ABSOLUTELY. I dare say that if Dana went off his trolley and published glowing praise of Jack Tramiel, he'd be out of a job so fast it would set new speed records (aside from how quickly the men in white coats would be round to fetch him). I'd be willing to place a large wager at good odds that NOTHING will ever be mentioned in STR about the numerous complaints against ABCO; yet they were prominent in several other publications for quite some time.

And, I might add, GEnie found STR to be disruptive and duplicitous, sufficiently to bar them from the service. Surely a trustworthy publication would have been able to appeal to their readership for support in such a case - but what happened? STR is no longer on GEnie.

a> Unless you can show me a better on-line magazine than ST Report, I will
a> simply hold the belief that you are a sad person who lets personal
a> disputes with one person become a problem for many.

You may believe what you like. As for a better on-line magazine, try Z*NET.

a> It was a small, one off joke article!!!!!!!? I can't beleive you are
a> so totally lacking an /any/ sense of humour!

It was NOT a one-off. It's typical of most of the "reporting" in STR's Atari section, in my experience. I look at STR once a year or so, now. At one time, I faithfully read every word of every issue (and I had to call long-distance to collect them, too). That was some time ago, and I keep hoping that Ralph will drop off the face of the Earth or something. I think Dana could do a real job of factual reporting, if left to himself.

s>> ST Report: Your Source for All The Lies That Fit In Print
a>
a> .. on what evidence!!!!? Show me a lie that STR has printed???

Good Lord, man, go look at the back issues. Start with the ABCO adverts and work your way up.

Now, can we PLEASE drop the damn topic? You can believe Ralph is the Second Coming, for all I care. I'll continue to believe he's the publisher of STR and the proprietor of ABCO.

Hallo Mario,

try the Setup with 150 Bd.! This rate is reserved for 115200 Bd. on fast
seriell ports, like such at the TT and MegaSTE. Other upper rates are:
134 ---> makes 57600
110 ---> makes 38400

This way you don't need any enhancer, like HSMODA06.

thats all for the day, good-bye

>For complete compatibility programmers should not make assumptions about
>the screen size...

True... I should have said "for complete compatibilty with STs, you have to stick with the standard three."

My point is that writing a program which takes advantage of a hardware overscan hack may or may not work on any given modified ST, and as far as I know, there's no way for the software to know whether the hardware it's running on has been modified, or in what way. Thus "overscan mod" programs are risky.

In the broader sense of resolution independence, a program should be able to run on an ST, TT or Falcon in any resolution... that's true.

Sounds pretty handy, where can I find it? I was messing around with a acc
called STREE last night and could only manage it to output to a printer.
supposedly it allows you to save the list to a file. But Gosh Darned if'n
I could make the puppy work...It kept locking up. A pretty nice little
acc except for that reason :)

Use a command line shell (like sh, csh, mupfel etc.) an the 'ls' command. Type:
ls -l > files.txt

mupfel.ttp is part of the Gemini desktop.

Hello,

Thanks you very much for people who provided info on DIY RAM upgrade. I have checked the "ramupgra.txt" about DIY RAM upgrade on the 520ST. However, I found that my 520STfm (UK) have 2 bank of RAM with one of them filled with 4 chips (4c256) making the total avaliable space for RAM chips being 8 instead of 32 as stated in the abovesaid article. Is there anyone out there experienced in upgrading this kind of ST?

Best Regards,

William

Has anybody succeeded in getting a Canon BJ200 to work with the
new NVDI? If so please post the control codes you have used.
On version 3 it worked out of the box, I had only to fool with
the margin settings. This time around nothing I have tried will work.
The printer just beeps as if it's set to the wrong mode, but it is set
right. I've even reloaded NVDI 3 to read out the control codes from
the old driver and put them in exactly that way to the new driver, but
iit still won't work. Any ideas?

I use Calamus with an HP5P just fine with BEAUTIFUL results.

However I am using it on the Atari and there are some of your questions I cant answer. I do know that my version will import GIF, TIF, IMG and a few other bitmap formats. I have the address for the MGI web page that could provide you with more answers to the PC version.

As with the Atari version there is a pretty good learning curve but if you have experience with other programs I think it will come fairly easy.

There is a demo of the program on the web page I believe and I will hasten to get that address to you.

1189. MagiC 4.0 for Win95

Newsgroup: comp.sys.atari.st
Date: 1996-04-17 00:00:00 UTC
From: "Stud. Daniel Burckhardt" <burckhar@math.ethz.ch>
Message-ID: <3174A797.6C53@math.ethz.ch>
Source record: 146873

I saw this message in the German MausNet and thought you would all be interested:

Application Systems, the makers of MagiC announced for the second quarter the availability of MagiC for Windows 95. It is a 68k emulator that emulates some hardware (sound chip, printer stuff) and does the ST-Resolutions (320x200, 640x200 in color, 640x400 mono) in a window, so it just looks as a regular Windows program.

They say the following software will be running: Signum!2, Signum!3, Signum!4, STAD, Phoenix, Papillon, Texel, ArtWorx, PureC, PurePascal, PureProfiler, Postfix, Ease but also GfA-Basic, Calamus.

NVDI will be running, supporting the Win95 TrueTypefonts and with a special module Postscript fonts.

The speed on a Pentium 100 should be about TT-Speed. Suggested are 8MB of RAM. The price will be 299 German marks (about $200)

For all of you who have a PC and still think of the great Atari-Times, this might be good news.

This smells a bit like cod to me. I would be very pleased if someone bought TOS
from Atari (who have no reason to keep it anymore) and then put the effort in
to be succesful with it. But, why on earth would Micro$oft be working with him
(or considering to)? This post produces more questions than answers.

Some late ST 520/1040 models did ship with a blitter installed.

It does make a big difference in things like window redraw.

o.k., I have checked some detais:

My 10MB memory expansion for the Mega STE is apparently attached to the
VME-Bus (thus the serial-2 port is removed).
It works with almost all programs (including games etc.) Only the PAULA sound-
emulator does only work, if the computer is booted with 4MB or the memtop is
set to 4MB (e.g. by a ramdisk). Most reset-resident ramdisks do not recognize the
enhanced memory on a warmboot; thus in this case a new ramdisk is installed
and the old one is no more accessible. The expansion uses a special boot program
and I guess also special hardware. Perhaps I should open the computer and
check it out, but I have not the time in the moment.

The expansion came from

Martin Wevelsiep Computertechnik
Bogenstr. 32
D-52080 Aachen
Tel. +49 241 167214
Fax +49 241 165157

but I do not know if it is still sold.

1195. ST to Ethernet?

Newsgroup: comp.sys.atari.st
Date: 1996-04-17 00:00:00 UTC
From: ktammine@messi.uku.fi
Message-ID: <ktammine.829728711@messi.uku.fi>

1196. HELP: XaAES no go on Falcon...

Newsgroup: comp.sys.atari.st
Date: 1996-04-17 00:00:00 UTC
From: chriswil@southern.co.nz
Message-ID: <4l2der$843@orm.southern.co.nz>
Source record: 146880

Hi There...

I have grabbed XaAES from rand.thn.htu.se and have attempted to run it. It refuses to work thus far and is looking like it is not compatible with my setup. I almost always run NVDI 3.01, but found that once MiNT has loaded the machine goes to a video mode that doesn't sync with ANY monitor I can care to name. With XaAES run from a shell using the -video 2 option, MiNT crashes the system with private memory violation. Without NVDI it simply gets as far as loading XaAES and then MiNT crashes the system complaining about private memory violation. I assume memory protection is on. My setup is as follows

Falcon030 4meg, PowerUp2, FPU
MultiTOS running MiNT 1.12, little else in memory...

My MINT.CNF has been trimmed to read

sln <xaaes dir on drive c:> u:\xa
cd u:\xa
INIT xaaes.tos

My XAAES.CNF is set as follows...

debug is set to u:\dev\null

clipboard is set to c:\clipbrd

toswin_30.prg is run to handle toswin

no other programs are run to start a desktop or anything else (I assume that xaaes.tos takes care of 'gem' startup)

Will I need to run a desktop? If yes, can one be recommended (I know thing v1.0 is now in english)

TIA for your help on this one...XaAES sounds promising

Chris W.

Source record: 146881

Are there any 600 dpi drivers for the new Canon laser printer (B&W) for
SpeedoGDOS ? I think any EPSON compatible driver would do as well.
Thanks,
David

What program? Which is totally integrated with... What?

Face it, Atari has better software, and for a MUCH lower price (hard-
and software combined). For MIDI, that is.

Followups set to comp.sys.atari.advocacy

> or do I still have the wrong type of SIMM?

You have SIPs in your STE; SIMMs have the edge connector. You probably have the right SIMMS, but you will have to de-solder the SIPs & fit SIMM sockets to the STE motherboard.

These sockets should be available from most electronic hobby stores or mail order electronics firms.

It might be possible to solder 30 pins onto a SIMM , but the possibility of bad solder joint + the difficulty in lining up the pins would make this not worth the effort.

Hello everybody,

Is there a way to convert X11, postscript or metafont fonts (or other formats)
to GDOS bitmap fonts (*.FNT) in arbitrary resolutions?
Which programs should I use and where can I find them?

Thanks,
Pim.

Hi , your father did very well, the 600c is far better than the 540.
I have the 540. For black and white, it's very good, but with the color
option the graphix are really bad.
Bye.

>Who needs bios calls..? You run the MIDI program. DUh..

If it's not in the BIOS, it's handled by software, which (as any
Windows user will tell you) isn't exactly rock-solid in terms of
timing.

>You plug the cable into the joystick port on the sound card that comes WITH
>the PC, just like I ALREADY SAID... Duh...

Really? Funny... I've been trying to plug my 5-pin DIN MIDI cable
into the Joystick port on my SB16.... it just doesn't wanna go. I
squashed the MIDI connector, so it's FLAT like the joystick port...
but it's still missing 10 pins!

>>How are those ports and their timing integrated into the rest of the system
>>& the bus?
>Who cares..? You run the program and make your music... Duh..

Please see my comment about BIOS vs. Software, above.

>>Built in on the ST and 'built in' on the PC aren't the same thing
>>by any stretch of the imagination.

>Bullshit. All that matters is that the user can plug in a MIDI device and
>use it. On EITHER system.

Not true at all. I'm not advocating either, but comparing MIDI on the
ST/Falcon vs. MIDI on the PC platform is, quite simply, comparing
apples and oranges.

(Please note as well that I'm not saying MIDI on the PC is necessarily
DIFFICULT, but it _IS_ DIFFERENT than the ST series.)

I have two problems similar to yours:

1. After reading from a floppy, xcontrol accesses drive A: (really
annoying if you just took out the disk).
2. When I use an autoload program (from harddisk), and this program uses
the floppy, the desktop wants to read from the floppy disk after I close
the autostart program.

I have a Falcon, 4MB, 65MB internal IDE hardisk, TOS 4.04
(I'll soon have a ZIP drive, once the idiots from the computer store
manage to order the right cable.)

I've got 6.4 (I think). But I was wrong about BINHEX.
ESSCODE can only handle MIME, UUENCODE, SHIP and BtoA. (I must say I
never saw any SHIP or BtoA encoded messages.)

1217. Is it possible to "TAR" more than one volume

Newsgroup: comp.sys.atari.st
Date: 1996-04-17 00:00:00 UTC
From: gigxr01@nt.com
Message-ID: <gigxr01-1704961339020001@ngalm099.gal.nt.com>
Source record: 146901

Greetings

I use Tapebios to backup my hard disks.

I usually 'dump' the drive, which puts an image of the drive on tape.

This can be wasteful, since you copy the whole partition,I would rather
just copy the files.

I use the version of TAR from Alan Hourihane (Tapebios creator) & this
works well, but I cannot figure out how to get TAR to copy files from more
than one partition at a time.

To back up a partition, I just issue the following from the shell :

'tar cvf =tape'

This will backup all of the files in the partition.

I want to be able to backup more partitions, but I can't figure out how to
tell TAR to do this.

Is it even possible ?

AFAIK, Alan's TAR is the only one modified to work with Tapebios. The
DOC's state that the 'append' function is not implemented, so I cannot
append files to an existing TAR file.

Is there a better solution than TAR/Tapebios ?

Hi, everybody.

So I got this used 1Gigabyte Hewlett-Packard 72560-300 hard drive working, at least to the extent of being able to read and write to it. A reckless use of ICD Pro and Diamond Edge (wonderful programs!) did the trick. However, I still cannot format it, or zero a partition using ICD. I suspect that I will never be able to boot from it, but that is not a major problem for me. It is now time for me to make a decision. Should I buy it (real cheap!), and hope that I never need to re-format it? Your advice is welcomed.

BM> Does anyone know of an app that would allow be to read the
BM> contents of a folder and export it as a .txt file and where to
BM> locate it?

I tried out a little prg called dirdump a few months back, and it worked fine on my TT. It was on a STart disk, IIRC. KnifeST and Diamond Edge will print directories, too. Magic Spool (was on an ST Informer disk) might be able to then print the dirs to disk, although I haven't tried it with dirdump, Knife, or Edge.

The NewDesk desktop print dump [>] works with MagicSpooler, too. I just tried it.

1220. Extra 16 MIDI channels on Atari Cubase

Newsgroup: comp.sys.atari.st
Date: 1996-04-17 00:00:00 UTC
From: Somebody Else <whoami@uea.ac.uk>
Message-ID: <4l32ml$4gk@cpca3.uea.ac.uk>
Source record: 146904
Cross-posted to: alt.steinberg.cubase,comp.sys.atari.st

Hi, regarding the technique of adding a further 16 channels
via the port on the back of the Atari ST by activating the
EXPORT.DR_ file in the MROS folder: My copy of Cubase v2.0
has not got such a file, nor similar.

Any ideas....

Cheers Stevie

PS Please don't e-mail back, but post a follow-up. I
have not got an e-mail account.

1221. Lawrence's Massive Auction 2

Newsgroup: comp.sys.atari.st
Date: 1996-04-17 00:00:00 UTC
From: lwright@wintermute.awinc.com
Message-ID: <4l1cq3$8gd@kryten.awinc.com>

Summary:
Keywords:

Yes, it's true! I'm moving, and I have a TON of games, new & old, rare
and common, good and sucky, for almost ALL major systems. Check it out at:

www2.awinc.com/users/lwright

It's a LONG list of stuff (30k) so I won't post it here often. The site
is LYNX accessible, and if you can't get to it, email me for the updated
list. Below is the preliminary list!

Subject: Lawrence's Massive Auction 2
Newsgroups: comp.sys.atari.st,rec.games.video.atari,rec.games.video.classic,rec.games.video.marketplace,rec.games.video.misc,rec.games.video.nintendo,rec.games.video.sega,rec.games.video.sony
X-Newsreader: TIN [version 1.2 PL2]

Summary:
Keywords:

Yes! It's Lawrence's Second Auction! I'm moving across the planet
(Canada to Australia) and I wanna unload some stuff! I'm slashing
prices! Flogging heirlooms! (They COULD be, if I had any heirs...)
and I wanted to give the happy USENet people first crack at my
stuff!

Rules are posted at the end, anything without a price I either don't
know the value of, or I wanna trade for it. Prices are in U$D to
keep things simple.

Updates will be posted at: www2.awinc.com/users/lwright

Summary of included stuff:

NEO GEO Duo Jaguar 7800 2600
5200 Play Station Laser Active Mega Drive
Rare & promotional items Old atari 8-bit stuff...
Atari ST gear audio compnents and gear weird bits o' whatnot
comics Laser Discs books etc!
Colecovision Intellivision Sega Master System

Keep an eye out for the left hand side: That's my want list! Also
see the end for add'l stuff I want. I'dd REALLY like the stuff on my
want list, so make me a crazy offer, I'll probably go for it.
Really. If it's on my want list, I want it enough to cross the globe

with it, so...

Atari ST stuff

Mega 2 ST x3 $40
Brand new, never used. Opened, touchscreen controller added, may or may not be included. Brand new mouse and keyboard, no power cord. MIDI ports have been disabled, but a steady hand and soldering iron will take care of that.

MegaFile 20 Harddrive $15
Old, clunker, no PSU, works great, MFM, no top to case.

Monitor Master $5
Switch from colour to mono with one button. Includes power switcher, automatically shuts off one monitor, powers up the other, and reboots the machine.

SLM804 Laser Printer $75
It's heavy, it's noisy, it dims the lights when you power it up! YES! It's the original 0MB RAM Atari laser printer! Works great, no box, lots o' toner, could stand a new drum, but I think it mostly needs a new corona wire. Prints great.

Big Box o' disks
We used to run a store. I'll sell this fantastic box full of over 350 disks (Mostly 'demo' copies, magazine disks, some original software...) for a reasonable price. All the disks work, and include a lot of rare stuff. Think of it: 350 disks full of new exciting software! all 720k or smaller, midi softs, demos, apps, etc.

Wanted:
Gemulator
TT RAM (preferably something I can add SIMMs to)
TT Graphics card
TT floppy drive
220v TT Power Supply (ie, for Australia!)

Atari 8 bit stuff

1050 Disk Drive
x1 - Happy-fied. Doesn't seem to work. $2
x2 - US Doubler. Works, noisy. $5

1200xl computer $10
no screws, works great.

800xl computer $10
great condition, works great.

Game Cartridges
Track & Field $2
Mr. Cool $2
Qix $2
Centipede $2
Basic $2
Moon Patrol $2
Pac Man (x2) $2
Pitstop $2
Dig Dug $2

Atari Consoles

Atari 2600 $5
New style console, in box, inst. & switch included.

Old style, three switches, works great. No box. $5

Atari 2600 Games (Do not include box or inst unless noted)
Canyon Bomber $1
Spider Fighter $1
Basic Math $1
Laser Blast $1
Astro Blast (x2) $1
Berzerk $1
Midnight Magic (New, unopened) $1
Deadly Duck $1
Vanguard $1
Demons to Diamonds $1
Turmoil $1
Combat $1
Space Invaders $1
Backgammon $1
Star Raiders (x4) $1
Starmaster (x2) $1
Stampede $1
Venture $1
Frogs & Flies $1
Asteroids (x2) $1
Brain Games $1
Missile Command $1
Space Jockey $1
Gorf $1
Final Approach Matt $1
Cross Forces Matt $1
Basic Programming (x2) $1
Warlords $1
Skate Boardin' (New in box) $2

Atari 5200 Console $10
Console, good condition, one controller won't fire, one only
fires one button. Box included, no inst, power supply works.

Atari 5200 Games
Football $3
Pac Man $3
Pitfall 2 $3
Dreadnought Factor $3
Dig Dug $3
Joust $3
Ms Pac Man $3
Vanguard $3

Atari 7800 Console $5
Box included, PS, at least one stick, mebbe two. Pole Position
2 included. Comes with a NEW UNOPENED Ms Pac Man! Woo!

Atari 7800 Games (New unopened)
One on One Basketball Matt $2
Karateka Matt $2
Ms Pac Man Matt $2

Sony PSX

PSX Games
Loaded $20
Ridge Racer $10
ESPN Extreme Games $10

Wanted:
Resident Evil
NeGCon
S-Video Cable
Memory Card, Game Shark, WHY
NEO GEO

NEO Cart System
Great condition cart system, includes two sticks and/or two
CD-type pads. Includes all original cables, box, brand new PSU
(At a cost of $100 CDN I might add!!!! Thanks SNK!)

NEO Cart Games
Samurai Shodown 1
Samurai Shodown 2
Alpha Mission 2

Wanted:
NEO GEO CD ROM UNIT!
Puzzle Bobble (Bust a Move) CD ROM
SamSho 1, 2 & 3 CD ROM

Laser Active

Pioneer Laser Active $200
Great condition, plays 3, 5, 7 & 12" cds/LDs, CD+G... Includes
Sega Game Pack, Robo Aleste SGCD game, Pyramid Patrol LD game.
Remote included. I'll throw in a couple of movies too, from the
following list.

Laser Disc Movies
Jurassic Park (CAV, Letterboxed) $50
Oh My Goddess Part 1 $25
Kimagure Orange Road $20
Penn & Teller Get killed $10
Astron Belt (ie, the original Sega Arcade game disc) $30
Shattered (Adult, X rated) $15
Ghostbusters (Criterion, Letterbox) $10
Vampire Hunter D (Dubbed) $10
Cliffhanger (Letterbox) $15
Top Gun (No sleeve, scratched, plays OK) $5

wanted:
Miracle Mile
Koyanasquaatsi

Sega Mega Drive

Mega Drive Console $25
Original Mega Drive. Includes original box. NTSC/PAL,
Japanese/American switches installed. A/V cable, PS included.

Mega Drive Games
Sonic 2 $5
Shooter (Fire Shark, I think) $5

Genesis Games
Sonic 2 (No Box) $5
Thunder Force 3 $10
Thunder Force 4 (Lightening Force) $15
Micro Machines $10
Ms Pac Man $15
Space Invaders '91 $15

Sega Master System

Master System Console (x2) $20
only one PSU for both, two guns, three pads, one large ugly
stick. Both work fine. Price is for everything.

Master System Games
R-Type no box, no inst. $4
Phantasy Star no box, no inst. $5
Gangster Town no box, no inst. $1
Cyborg Hunter $1
Double Dragon $1

California Games $1
Alien Syndrom $1
Spy vs Spy $1
Galaxy Force $1
Cloud Master $1
American Baseball $1
Wonder Boy $1
Space Harrier 3D no inst. $1

TurboGrafx-16

Duo Console $50
incl. box, PSU (Newly replaced), A/V Cable, one pad + one stick
(Japanese, not the crappy NA one). I'll also throw in one game
from below.

Turbo Grafx 16 console $15
MINT condition, in box, all manuals and posters still sealed in
plastic. Includes Keith Courage.

Turbo Grafx 16 games
Blazing Lazers $5
Super Star Soldier $5
Galaga '90 $5
Side Arms $5
Y's 1&2 CD ROM $5
Lords of Thunder $5

PC Engine games (ie, TG-16, need converter)
Devil's Crash $10
Alien Crush $8
Final Soldier $10

PC Engine CD ROM games
Panic Bomberman $20
Cho Aniki $20
Ai Cho Aniki $25
Super Raiden $15
Side Arms Special $15

Intellivision

Intellivision Console $5
Good condition, newly replaced controllers, two stick
attachments, one missing foam. Works great.

Intellivision Games All games w/out box and ins unless noted.
All games incl. overlays unless noted.
Snafu (no overlay) $1
Golf $1
Major League Baseball $1

Bowling $1
Skiing (x2) (x1 no overlay) $1
Auto Racing $1
Boxing $1
Tennis (x2) (no overlay) $1
Sea Battle $1
Lock 'n Chase (x2) $1
Frog Bog $1
Space Armada (No overlay) $1
Space Hawk (x2) $1
Star Strike (x3) (x1 No overlay) $1
Armor Battle $1
Astro Smash $1
DragonFire (Inst. Incl) $1
Pitfall (No overlay) $1
Tron Deadly Discs (Inst. Incl) $1
Tron Maze-a-tron $1
AD&D Treasure of Tarmin (Inst. Incl) $1
AD&D (no overlay) $1
NFL Football (Inst & Playbook Incl) $1
Space Battle (x2) $1
Poker & Blackjack $1
BackGammon $1
Atlantis $1
Stampede $1
Mouse Trap (No overlay) $1
Demon Attack (inst. incl.) $1
Beauty & the Beast (No overlay) $1
Checkers (No overlay) $1
Carnival (No overlay) $1
BurgerTime (inst. incl) $1
Reversi (No overlay) $1
Royal Dealer (No overlay) $1
Triple Action (No overlay) $1
b-17 Bomber (No overlay, no voice module) $1

ColecoVision

Colecovision Console $5
Great condition, two power supplies, two working controllers, TV
switch.

Colecovision Games
BC's Quest for Tires (Label all but missing) $1
Carnival $1
Cosmic Avenger $1
Donkey Kong (x2) (inst incl) $1
Donkey Kong Jr $1
Dukes of Hazard $1
Lady Bug $1

Mouse Trap $1
Pepper II (inst incl) $1
Pitfall $1
River Raid $1
Smurfs $1
Space Fury (x2) $1
Sub Roc $1
Time Pilot $1
Venture (inst incl) $1
Zaxxon (inst incl) $1

For the comics, make me your best offer. I'll take anything. They just suck up space on my shelves, so... Go ahead! Fleece me!

Here are the phone numbers for the two places I mentioned earlier for Atari parts and products:

Toad Computers (800) 448-8623 or (410) 544-6943

Best Electronics (408) 243-6950

Give them a call and ask for their catalogs. Both stock lots of good stuff for Born-Again STers..!

:)

>I have a Mega STe with 10 MB...

This is very interesting..!

You mentioned the Serial 2 port being removed... does that mean the extended memory is on a VMEbus card..?

Is there any kind of special driver that loads when you boot up..?

This question comes up from time to time (extending memory beyond 4 MB), so it would be good to know more about it for the next time someone asks...

Source record: 146660

>If it's not in the BIOS, it's handled by software...

Hmm.... BIOS... Basic Input/Output System.. that wouldn't be "software",
would it..?

The ST has low-level routines to handle I/O and timing to the MIDI ports,
that's very true. The software on the PC platform isn't as tightly integrated
as on the ST, that's also true. But the difference isn't likely to affect
the end user very much unless they're into professional production, in which
case something like a Falcon030 is probably more useful than an ST anyway.

>Funny.. I've been trying to plug my 5-pin DIN MIDI cable into the Joystick
>port on my SB16...

You might want to read my full message first, instead of just the selected
excerpts from my friend "Mr. JEDI"... in which I explained the adapter
cable used to convert from the TTL voltage levels of the SB16 to the 20ma.
current loop levels of the MIDI device, which includes both MIDI IN and
MIDI OUT connectors as well as a pass-thru port for the joystick.

You might also note that the ST doesn't come with any cables either, so
obtaining an adapter cable isn't all that different.

>(Please note as well that I'm not saying that MIDI on the PC is necessarily
>DIFFICULT, but it IS _DIFFERENT_ than the ST series.)

Different in the technical details, but mostly transparent to the end user.

On either system you obtain cables, run the software, and make the music.

The point I was making in my original message was not that the PC is better
for MIDI than an ST (it's NOT), but that the statement that STs are better
because they come with MIDI ports built-in (a statement made in a previous
message in this thread) is no longer true.

AIUI write errors on hard drives are reported regardless of write verify on
or off (you'd set that in the hard drive booter prog)

Speak to 'ya later!

Eric Hays (szhays@chip.ucdavis.edu) wrote:
:
: I have successfully loaded pages with width and height commands, although
: CAB hasn't scaled the images so they were displayed at the wrong size.
: But it didn't lock up either. I don't remember if the pages I loaded
: expressed the width and height in terms of a percentage of the window or
: int specific pixel dimensions. I know I've loaded pages using the latter.
: I'll give the percentage ones a try asap.

Well, I double checked and I can load scaled GIFs either way. Of course,
they don't actually end up scaled when they are displayed. But no bombs
or crashes either.

I'm having real spotty reults to in-line JPEGs. At first I was going to
say it doesn't work at all, then I found a few pages where it worked.
For the most part though, inline JPEGs just don't show up. And then I
too have been having the problem of JPEGs loading most of the way and
then the system just hanging until I hit the escape key, at which point
CAB often displays an earlier JPEG for the JPEG that didn't fullly load
(often resulting in really goofy page layouts).

: Could anyone tell me where I can get hold of a copy of HTML Browser?

HTML Browser had a name change six months ago. IT is now called CAB.
The latest version is CAB 1.2 which I don't know where it is besides
http://www.student.informatik.th-darmstadt.de/~aclauss/

Earlier versions are on all the major ftp sites. I suspect 1.2 will
migrate shortly (it is only a few days old).

I purchased the Phase 4 package from Computer Direct just a little over
a week ago. Chris was very helpful and my order arrived promptly.
I will do business in the future with them as he was <very> upfront
about what he stocks and the when's and if's on something's availability.
I HATE TO BE TOLD THAT SOMETHING IS IN STOCK AND THEN BE TOLD THAT
IT HAS BEEN BACKORDERED AFTER THE CREDIT CHARGE IS MADE OR THE CHECK
HAS CLEARED. You know who you are :)

Thank's Chris, for the professional service.

Mike

>(or considering to)? This post produces more questions than answers.

It's _another_ market to gain a monopoly in, dude. That's what Microsoft is
best at! From Steve's perspective, if he had Microsoft support it would go
a _long_ way toward insuring the survival of any computer line he launched.

The cod you smell is that Steve may not be able to pull it off for a variety
of reasons. They range from Atari setting an unreasonable price for TOS, to
the difficulty Steve is having in finding 68030 capable programmers. Trying
to bring a new machine to market is a _very_ big job!

1233. FS: DeskTopper Case for Atari ST, STE, Falcon (U.S. only, please)

Newsgroup: comp.sys.atari.st
Date: 1996-04-18 00:00:00 UTC
From: Michael Grove <mgrove@owens.ridgecrest.ca.us>
Message-ID: <Dq1qD7.K92@ridgecrest.ca.us>
Source record: 146668

Once again I am relocating my Falcon mother board.

So,for sale is a DeskTopper case. Fits ST, STE, Falcon.

Comes assembled (this is no joke, it is a bear to put together :)

200 watt powersupply is mounted inside for powering drives.

Falcon power plug NOT installed (I thought that was safer).

Fan mounted for powersupply cooling

KeyBoard Gizzmo included and mounted
(At this time, the Keyboard Gizzmo has the following defects
(Will not work with VideoMaster Falcon, probably VideoMaster ST as well
(I have been told that it will not work with Screen Blaster
(I have been told that one person has problems with Apex, but works fine for me
(Numeric keypad numbers do not work, arrows and functions work well
(the '5' key need an extra press sometimes
(As the Gizzmo has the drivers on chip, a future upgrade from
(Chro Magic should be available soon
(all other software works fine Internet-graphics-dtp

I have three HD's and a CD Rom inside. The holes are there for you
to mount what you wish. You provide your own SCSI/IDE cables and plugs.
My HD's and CD Rom are NOT included :)

Free Keys included.

Oh Yea, the case is painted black.

$125.00 plus shipping. cashiers check, please. Shipping collected C.O.D by UPS.
U.S. sales only, please.

First come first serve by date (or time) on email to me
or phone 619-375-8672 after 5:30pm till.... :)(westcoast)
619-939-8286 8:30 to 5:00 days

1234. Trade: ATI Mach 64 4MB VLB PC Video card for 24bit 2MB VME TT 030 Video Card

Newsgroup: comp.sys.atari.st
Date: 1996-04-18 00:00:00 UTC
From: Michael Grove <mgrove@owens.ridgecrest.ca.us>
Message-ID: <Dq1qx0.KJr@ridgecrest.ca.us>
Source record: 146669

Will trade the Mach 64 4mb VLB card for a 24bit 2MB VME TT 030 Video card
with NVDI ET drivers. Cyrel or Nova. Or the card must be able to display 800*600
24bit depth.
ATI card comes with drivers and software, books. 1 year old. Cost
$580.00 new. If you have a Pentium with VLB, this card may not be compatible.
Check with your manufacture first. Works great on 486 VLB systems. Comes with
Auto Cad graphics engine. Very cool.

email the deal to:

mgrove@owens.ridgecrest.ca.us

>
>Am I missing something here? I've read all the docs to see, but I just
>don't seem to be able to make much progress.
>
>Can anyone help? Guy?

Something has screwed up! (aggh).

Basically, the whole installation package revolves around shel_read().
When each program starts up, it obtains the executable path from
shel_read(), strips the filename and remembers the path. All the files
it tries to access are built from this and all the batchfiles and file
operations are specified relative to the current executable path. This
lovely fluffy (multitasking friendly) solution has a wart -
shel_read() is broken under some TOS versions.

The backup method is to use Dgetdrv() and Dgetpath() which will only
fail if you do a right button double left click to execute the program
'cos the TOS current directory stays on the active window.

I tested this on my TOS 1.4 and it returned the full path. I tested it
on TOS 1.2 and it only returned the filename so I adopted a simple
test. Call shel_read() and if there's no ':' in the returned string
it's broken so implement Dgetpath() etc.

I have a horrible feeling that maybe some broken shel_read()'s are
returning the filename with the drive letter and ':' on the front. If
this is the case then the code will never use the backup method. I
have an even more horrible feeling that I've actually seen this before
in the past. Worse, this will be common to all the installation
programs. Bugger :-((((((

Only one vague glimmer of hope. I did the TOS 1.2 test on a floppy.
Maybe (and a big one) the drive letter and colon are not prepended for
a floppy. If you were to copy the folders SETUP\, CAB\, CAB_OVL\ and

their contents to a floppy and try them from there you might be lucky.

Please let me know if does happen to work!!!

I'm afraid the answer is quite simple - I didn't know they existed! I
kept hearing the terms 'modem 1' and 'modem 2' and assumed they were
interchangeable with the word 'serial' until after it was released.
Sorry. ;-)

> Sorry if this sounds like a gripe, but I have owned a TT since
>1990 and got even less supprt from Atari than Falcon owners did (if
>that is at all possible!).

Can you post exactly what text needs to be assigned to SERIALPORT and
I'll promise there'll be two more boxes in the next version. :-)

#>> of Thing in any language, unless Arno decides to pass Thing to somebody
#>> else.
#>And the same Thomas that wrote this statement is going to take over, at least
#>that's the latest from Arno in the MausNet.
Yes, that's right. But at the time I wrote the message, I had just offered it
to Arno, so I didn't want to make any false "promises" here.

#>So the statement is not as sad as it seemed! Good luck to Thomas (Registrations
#>for the 1.0 version is still by Arno) and we wait for your comments!
Thanks. My first "target" will be to fix the bugs I have encountered when
running Thing in 1024x768x16 under MagiC (strange, but not with TOS and the
same resolution), and some other minor problems. I have some ideas for new
features, but that will take some time, because I'll first have to get
familar with the sources.

Ah, yes, I'll also try to link Thing with the MiNTLib, I hope that will
remove some memory problems with the color icons in >16 bit (I know that
these problems aren't cause by the color icon routines, because my demo
programs work well in 24bit).

I hope that Joe Connor will continue his support for an english version
of Thing, so that there'll be an english release of the next version ASAP.

Ciao

: me more about it? Thanx

I did some overscan on my STE five or six years ago, and it was actually very easy to remove the lower border.

The way I did it was to install a HBL-routine that just incremented a counter, it counted scanlines. And when the counter reached 199 (The second last scanline), I changed the HBL-vector to point to a new routine that did the actual overscanning.

It just waited a specific number of NOPs (9?), changed from low to high resolution, then waited 4 or 5 more NOPs before it changed back to low. That was enough to confuse the shifter, and it ignored the DE-signal.

I can't remember how I removed the upper border, but it was a bit more difficult. It also used more CPU-time.

>>If it's not in the BIOS, it's handled by software...

>Hmm.... BIOS... Basic Input/Output System.. that wouldn't be "software",
>would it..?

BIOS is ROM; a far cry faster than software routines in RAM. But you
obviously knew what I meant.

>The ST has low-level routines to handle I/O and timing to the MIDI ports,
>that's very true. The software on the PC platform isn't as tightly integrated
>as on the ST, that's also true. But the difference isn't likely to affect
>the end user very much unless they're into professional production, in which
^^
>case something like a Falcon030 is probably more useful than an ST anyway.

Whether or not 'professional' production is the desired result is, in
my opinion, moot. As for the Falcon being better than the ST, that's
true... but I've done sequences for albums with the ST. <shrug>

>You might want to read my full message first, instead of just the selected

I apologize that I was unable to see the first message. It doesn't
change the fact that your reply, which I _did_ see, was patronizing
and completely downplayed the obvious technical and functional
differences between the two platforms (I believe your term was
"Pro-Atari FUD").

>You might also note that the ST doesn't come with any cables either, so
>obtaining an adapter cable isn't all that different.

Oh, come on. Reaching, are we? "Cables" for the ST come with
virtually every piece of MIDI hardware on the planet. If not, they're
$1 a foot or less, store-bought. The SB MIDI "Adaptor" is $50Cdn,
last I checked! That, to me, is a DRASTIC difference.

>Different in the technical details, but mostly transparent to the end user.

I disagree. Only after the extras are obtained, then is it
transparent (although even this is arguable). Before that, no.

>On either system you obtain cables, run the software, and make the music.

...and wonder why the timing of your 32nd-note viola and violin
passage in that particularly involved passage sounds like a train
wreck... ;^)

...and attempt to remove the IRQ conflict when you add or change
hardware in the system... ;^)

>The point I was making in my original message was not that the PC is better
>for MIDI than an ST (it's NOT), but that the statement that STs are better
>because they come with MIDI ports built-in (a statement made in a previous
>message in this thread) is no longer true.

While I could argue this point on behalf of the MIDI/Computer newbies
of the world, I won't. Instead:

The fact that the ST comes with built-in MIDI has NEVER been a true
indication that it's better; it's much deeper than that. It's the
fact that MIDI I/O is on a system level on the Atari, but is higher on
the PC. Now, of course, if you're using a 133MHz-Pentium with 32Mb of
RAM, you'll not have to worry much about that; if you're on a more
limited budget, then this will definitely come into play (especially
with Windows-based packages).

1255. TT/Logic/Synthworks Compatibilty Woes

Newsgroup: comp.sys.atari.st
Date: 1996-04-18 00:00:00 UTC
From: Darius Taghavy <dart@ycrdi.com>
Message-ID: <31765A6D.3B48@ycrdi.com>
Source record: 146690

My friend just purchased a TT. Now several programs don't work with it. Logic opens a "key not found" dialog, even though the Log 3 interface was attached (tried wiggling different positions too). The Log 3 is rev F. Steinberg Synthworks M-1 and Roland LA editors also don't run (bombs on bootup). Now I've been repeatedly told that Logic will run on a TT (and that Notator won't). I also vaguely remember that Emagic will exchange dongles to make it work. Does anyone know about this? How about the Steinberg stuff? Is that supposed to run? If yes, then maybe the TT's connector is suspect. Oh well, another "smooth" upgrade ;-)

1262. I am leaving HENSA/micros

Newsgroup: comp.sys.atari.st
Date: 1996-04-18 00:00:00 UTC
From: efac001@alpha.qmw.ac.uk
Message-ID: <4l5l7e$51b@epsilon.qmw.ac.uk>
Source record: 146697
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi everyone

Just a public announcement of my departure from HENSA/micros.

I have been offered a job elsewhere with better prospects. This is not to say that I am abandoning the Atari market.. far from it!

I have thoroughly enjoyed doing the Atari section at HENSA and would have done more if I could. I do apologise for the drop in number of new files over the past few months but I also had to tend to the Mac and Amiga archives which needed more attention. There is so much a single person can do, and managing three platform archives is pretty tough.

I do feel sad about leaving.. I feel that the work I have put into the Atari section will go to waste. I really don't know what the future holds for it.. maybe it will be deleted, or just left to rot... and I don't like the thought of either of those. :-(

Anyway, I must thank you all for supporting me and if it wasn't for YOU I would have not got to this stage of fame... which still surprises me when someone mentions they 'know' me and I don't know them!

Thank you for all your support. I will definitely miss serving more programs to you all via a software archive.. it was fun while it lasted.

I will still be around on Usenet. :-) and my shareware scheme will still be running, and I will continue to write for Atari mags.

I am here at HENSA till the end of May.

Your humble servant
Denesh/Danny

>"overscan mod" programs are risky.

It really comes down to clarifying the situation. Use of Gem
guarantees you (within ill-defined limits) the *ability* to write
resolution independant programs. That is fairly 'exact' except for
"resolution independance" - what is it?

It might be easy to say - well it should look the same. That's a non
starter. It would mean that a low res alert would be required to fill
up the same proportion of the screen which is silly, apart from all
the problems with colour or lack of it.

I could take it to another extreme but there is no point. We can all
see that the definition lies in the indefinate grey area of common
sense and reasonable compromise.

Standard Gem has an 8x8 system font and an 8x16 system font. This
makes sense because in two of the three predefined resolutions the
screen height is half that of the third. Where does the 6x6 font fit
in? Shouldn't there be a 6x16 font also? Or if this is how the system
was supposed to be where is the system 16x32 font for 1280x800 rez?
Looks like even the designers couldn't make up their minds!

With this in mind, it would be fair to say that a given piece of
software (typically a game), even if it does access hardware, can be
considered resolution independant - you just change the definition!

>In the broader sense of resolution independence, a program should be
>able to run on an ST, TT or Falcon in any resolution... that's true.

The usual C runtime startup is quite involved. It doesn't actually do
any Malloc()'s until after the Mshrink() but I can see it not being
instantaneous as it were, especially if there is a large environment
to scan.

It is possible that one process gets started ok. As the next gets
started, it could be task switching during the runtime startup code
back to the first which just so happens to issue Malloc() which
promptly fails.

>#>[...]
>#>I'll give it a try.

>Tell me if it works, then.

It appears better but as it doesn't happen too regularly anyway, it is
a bit early to tell.

>#>[...]
>#>Thanks :-)
>You're welcome...

A thought has just crossed my mind. I'll have to look at the startup
assembler code - if it turns out to be trivial then I could enter
supervisor mode very early and stay there until just before the module
calls main().

And on third party code, I could use LimitMem to see if this has any effect.

Hi all,

another wee buglet I've found: when I uploaded a load of image files to my web site and somehow forgot to make them world-readable, CAB seemed to go into a loop dowmloading the same 22 bytes all the time. I think it was mis-interpreting the "No access" message and making an immediate retry.

It's still a great piece of work. :)

Sounds like you want the original, written-by-source-code-hackers-for-source-code-hackers, program/text editor, vi. I found a few variants available on the archive sites. I recommend stevie over elvis. nvi is also better than elvis, although I don't know if there's an Atari port. (I've been through this with DOS, trying to find a *real* editor when I'm stuck using a PC, and after a couple sessions with elvis (the default vi clone on Linux) I was desperate to find a better clone, so I know of several vi variants out there.)

So anyway, to make it short, try vi. It's got a learning curve, and it ain't GEMified, but it's undoubtedly the best pure text editor, IMESHO.

>"/" as "\" in all addresses, since I get error messages telling me that there
>is a problem reading file "\". BTW, I'm using a MegaSTe
>

hi John

Sounds like you've not got cab.ovl in your cab folder - it needs to sit in
there alongside cab_jpeg.ovl for everything to work. ISTR someone saying
it wasn't included in the CAB1.2 file - simply pop CAB.APP and the new
cab-jpeg.ovl from CAB 1.2 into your old WWW130 folder (replacing the old
CAB.APP) and it should all work:-)

Good luck

Andrew

1276. A minor STiK bug solved, partially!!

Newsgroup: comp.sys.atari.st
Date: 1996-04-18 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <4l6ak4$2bc@madeline.INS.CWRU.Edu>
Source record: 146811

I had a minor but nagging problem with STiK that
I partially solved last night, and thought I'd pass it along.
I just got a used TT, and FINALLY figured out how to use HSmoda06
(whose instructions really leave something to be desired!!!)
so I could use the higher bauds on serial 2. So I went out and bought a
new 28.8 modem, of course, to use with it.
But, every time I tried to use stik, it told me that the
modem was ONLINE, already!! I then had to click on "hang up modem"
before STiK would run. A minor inconvenience, to be sure, but annoying
anyway. Well it turns out the built-in default set of instructions was set
for what a MAC needs, i.e. DTR is always asserted. So Stik thinks it's
already on line.
The problem was solved, or patched by putting at&c1 after ath,
in the script. The original setting was &c0, which keeps the line high.
(the MAC uses another line for DTR!) now when I disconnect at the end of
a session, it really hangs up, and the modem light goes out.
When I sign on again, STiK works fine.
I hope this little note helps someone else, who doesn't even
know there is a bug, or what to do about it.
If anyone else had this problem, let me know, out of curiosity,☐.
And if you have a more permanent fix.

Source record: 146812

>the loss of speed is 50%..

I guess that's reasonable, considering the drive has to re-read the sectors after writing to verify the data.

What I was thinking was that if it took 5 seconds to write a file with verify on, the 2 and a half seconds you'd save to write it with verify off wouldn't be worth the risk...

I do know that I've done it with floppy disks, and the speed increase is really surprising, expecially when combined with a "twisted" format... but I stopped turning off write verify because I did run into errors when I was the Software Librarian for our local Atari users' group. The time saved when duplicating a large number of disks was nice, but it wasn't worth the risk of creating bad disks.

1278. Tempus Versions?

Newsgroup: comp.sys.atari.st
Date: 1996-04-18 00:00:00 UTC
From: jperez@Hawaii.Edu
Message-ID: <Dq2qs4.L7o@news.hawaii.edu>
Source record: 146813

Greetings,

As many of you who have ever experienced Tempus II (a text
editor), you may have noticed that it is many times faster than any other
similar product. I love this program! The only problem is that it
requires ST resolutions such as ST-High, something that I rarely use
anymore. I have seen a demo of a european release of Tempus that was not
resolution dependent, and was wondering if this was ever released. Does
anyone out there have a version of Tempus that will work in Falcon
resolutions? Any help or info would be greatly appreciated.

>
>You might want to read my full message first, instead of just the selected
>excerpts from my friend "Mr. JEDI"... in which I explained the adapter
>cable used to convert from the TTL voltage levels of the SB16 to the 20ma.
>current loop levels of the MIDI device, which includes both MIDI IN and
>MIDI OUT connectors as well as a pass-thru port for the joystick.

And also costs 60bux and at the same time, doesn't even give you a
dedicated port. It's still piggybacked onto the same external connection
as the joystick.

Also, it is an extra addon that is rarely sold with the machine and
is not widely sold. IT is not 'built-in' by any stretch.

It's like saying that ST's have 'built-in' SCSI because there is
an aftermarket adapter that you can plug in to one of the ports.

Okay, I know this might sound old, but I haven't really been up-to-date with the workings of Atari...

Anyway, I seem to have contracted an old virus, the one that affects getbpb() (is that it?). I don't have a hard drive to load up off of, and I can't find an uninfected disk.

I know where to find the proper anti-virus, peneciln, but I can't download it until i get a cleanly-formatted disk. Does anyone have any suggestions?

(In case it's important: I have one double-sided disk drive, a memory-extended 520ST (extended to a 1040), and TOS in ROM)

I don't know when or where I contracted it, but I'd appreciate any help.

Thanx

Have you seen the 4 CD-ROM sets from Activision that I found purely by accident. They come in pretty large boxes and all follow a theme. I found them at Kay Bee Toys & Toy Works as close out software but In never found them advertized anywhere. These are for the MS-DOS machines by the way.

Three of the 4 themes are SCI-FI, ADVENTURE and COMEDY. I forget what the fourth one is. I bought the ADVENTURE CD-ROM, but would like to get the COMEDY one. I have never seen it around here. Can anyone help?

I just upgrade from MagiC2 to MagiC4 and have a few questions about the desktop icons.

I know MagiC4 allows the changing of icons, however, I have been unable to change any of the desktop icons. Is it possible to do so? If so how?

I prefer the HD icon from MagiC2 and the printer and trashcan icon labels have gone from english to german. Is it possible to get the old HD icon and the english icons? If they are available can MagiC4 access external icons?

Err, how exactly do you get the files? I've tried requests to

mserv@FTP.toad.net
mail-server@FTP.toad.net
toad@FTP.toad.net
ftp@FTP.toad.net

the first three came back to me with no user and the fourth has had no reply?

As to the problems unpacking the files, perhaps a different rev of packer has
been used, causing some errors. Check the date the file was packed and try and
work out what rev of packer was being used at that point, some packers don't
have a perfect record of backwards compatibility and you therefore need to
find an older version.

I had done a project about MIDI for a college course and I found out some
things which I feel I should say concerning this thread....

First of all, MIDI is MIDI no matter what the port is. All MIDI
instruments have the standard 5-din ports. Interestingly, not all
computers that use MIDI have the standard ports. So they use
interfaces. Sound Blasters use MIDI through the analogue joystick
port which has lots of pins to go around, Amiga's have MIDI on the
pritner ports, and Mac's need the interface as well. Only the Atari
ST and Falcon computers have the standard ports, even though they
include THRU in the OUT ports which is not standard. But since THRU
is hardly used this is a moot point.

True, Mac's and Amiga's need interfaces to use MIDI. And PC's need
SB cards to use MIDI and SB's are seperate from the actual PC's even
though they come with multimedia setups(this is the same with modems
as well). But they all can communicate with MIDI devices the same
way if they need a serpate interface or have built-in ports.
Yes, you do need a seperate cable to hook SB's to MIDI keyboards but
is it any different than using a DB-9 to DB-25 cable for modems?

As for software calls, the ST uses XBIOS which is exclusive to Atari
computers while PC's need to have the Sound Blaster driver installed
at boot up. But all computers are like this with using printers,
modems, and even disk drives. Only it's nearly transparent to the

end-user.

The only advantage I see of PC's with Sound Blasters over ST's is that SB's can play MIDI files without requiring a seperate MIDI instrument. But it an work with keyboards as well as an ST, as long as you have the SB card and cable. What I would love to see on PC's is networking through MIDI instead of expensive Novel cards. Using special adapters which you plug in other computers as well as joysticks, you can have Deathmatches without much cost except for 2nd hand PC's. I hope this clears up some things, thank you.

Hi all...thanks for all the suggestions. I posted this earlier but it may have gone missing, so I'll repost.....

OK...here's my problem with the SETUP. All my files are in the WWW130 folder in the root of drive I. I go into WWW and then into the SETUP folder, and click on Setup.PRG. I then get a message saying ' Cannot open Resource' I:\setup.rsc '. I copied setup.rsc into the root directory to see what would happen, and went back to setup.prg. This time it gave me the language prompt. I selected English, and then got the error message ' No setup data '. I then copied setup.dat to the root (noting that pug.pos had been created) and tried again. This time after having gone through the language selector I was confronted with the message ' No batchfiles ' and indeed, there were none. This time I wasn't sure how to progress so I didn't.

Am I missing something here? I've read all the docs to see, but I just don't seem to be able to make much progress.

Can anyone help? Guy?

Thanks!

Simon

>It heavily uses the DSP so a TT version would be unworkable. :(

It's true that BAD MOOD currently relies very heavily on the Falcon's DSP.
Earlier during the development (before the texture mapping went in) we had
'030 only versions, though, and there's still a lot of '030 code in there.

By combining the current and older '030 BAD MOOD code with parts of the
French DOOM engine (whatever it's called), a 68k only engine with all
the features of the latest DSP based BAD MOOD could be built.

Since the TT does not have any kind of 'chunky' graphics mode, an extra
stage with 'chunky to planar' conversion would have to be added.

Naturally, a fully 68k based BAD MOOD engine would need some serious
horse power to reach the speed we get using the DSP and 16 bit colour.
A 50MHz '030 probably couldn't do it, but a good '040 might well be faster.

There's _no_ work being done (or planned) in this direction at the moment.
The old DVIEW port works on the TT, but there's a huge step from that
engine to what we have now.

Well, thankfully some of us don't have to use PCs with Microsoft products...

I've been using Outside on my Falcon for a year or two now and it's very
nice indeed. I usually have it set up for 1Mbyte ST RAM and 3Mbyte
alternate ('virtualizable') RAM, with a total virtual memory of 16Mbyte.

Most of the time the disk paging is not noticeable, even though I have
just about everything but the screen memory in virtual memory space.

Large compiles using GCC or manipulation of 2000x2000 or so (8 bit) pictures
(using MGIF, naturally ;-) poses (almost) no problem at all.
(A 'smart' idea I had a couple of years ago totally breaks the 'locality of
reference' principle that VM relies on. If the amount of free memory is
not quite large enough, there's a _lot_ of disk activity and the computer
slows to a crawl. That routine will be rewritten shortly.)

Virtual memory performance will always depend on what you do of course.
Still, it's often a good, cheap, solution.

There is one glaring difference that _DOES_ make the ST better at MIDI than
a PC (for most musicians, any way...) Buying an ST for sole use as a MIDI
machine will be _SIGNIFICANTLY_ cheaper than buying a PC for the same
purpose.

Hi all,

I`m a bit new to this news group but I have to ask (plea) for something.
Since I`ve got my Atari I had this game called Asterix : Operation Getafix.
Some of you might know about it, so this is what I want.
I would like to know where the bay leaves are in the game. I`ve looked
everywhere for it and I still can`t find it! Also how do you get into the
Roman camp and how do you capture one. If you can help me please reply back
to me at the address below via private e-mail.

Many thanks

Sudden View. I got the shareware file version. I liked it. So, I bought it. Turned out I bought the very same shareware version I already had. I was supposed to send in more money for the full version. Got pissed off at this _stupid_ marketing idea, chucked it in the back of my closet, & haven't used it since. :)

But it was really fast, and did a lot of 'different' things with text. The user interface was so different it was hard to understand what one was doing at times - But it had some nice features. (Marketing was not one of them.)

These clocks do not depend on mains voltage or frequency to keep accurate time.

Just how slow is the clock ?

On my old Supra host adapter, the clock would run slow when the battery
was on the way out.

Well, I am unable to get it to go higher on my TT.

Likewise, Connect seems to agree with me on this point.

> : Modem 2 and Serial 2 are capable of higher speeds as they are controlled

You are right. I'd been reading another group and the NCR 5301 seemed to
stick in my mind - I was falling asleep while reading/replying to this
group, and facts got intermingled...

The Zilog 8530 SCC is used in the TT (or is it the CMOS version - 85C30)
for Serial 2 and Modem 2.

>
> If you reply, please reply to my email-address as well.
>

From what I remember, MROS (Midi Real-time Operating System) was developed by Steinberg to allow more than one midi related program to run simultaneously on the ST.

This means that only Steinberg will have the information/developers DOCS.

You don't need MROS to write Midi programs for the ST, many good Midi sequencers were produced before its appearance.

I can make two suggestions.

1. If you are writing a sequencer or system exclusive handler & you find that bytes are being lost, you may need to increase the buffer.

I'm sorry I can't tell you exactly how to do this.

2. There are problems with the Midi port & Keyboard; I think they share the same
interrupt, some programs install a new keyboard driver.

Try posting to comp.sys.atari.st.programmer.

1308. Changing resolution on the fly with Ease 4, MagiC 4 and NVDI 4 matgraphTC

Newsgroup: comp.sys.atari.st
Date: 1996-04-19 00:00:00 UTC
From: "Dr S.G.K.Williams" <williamssg@cf.ac.uk>
Message-ID: <Dq3u0D.1vG@cf.ac.uk>
Source record: 146609
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Any owners of TT graphics cards may know that NVDI4 provides on-the-fly resolution changing without rebooting. Unfortunately Ease doesnt support this and you need to use MagiCdesk. Rob Perry offered a possible way of doing this from Ease by using alt-ctrl-esc and trashing ease from ram, hence forcing magicdesk to run, then alt-r to change resolution. Well, here's a way of setting up ease to change resolution with just a single key press! (under Magic 4, NVDI4 and Ease4). This works on the Matgraph TC version of NVDI4, it might on other graphic cards also. The only disadvantage of this method I can see is that any programmes set to single task will unload Ease after running, so a forced rez change after using a single-tasking programme is reqd to reboot in Ease.

1. Remove EASE as the shell for Magic, edit the MAGX.INF file and put a semicolon before #_SHL C:\EASE\EASE.PRG (or remove altogether)

2. Include the statement #_AUT C:\EASE\EASE.PRG to register Ease as an auto-load application (before TRM statement) in magx.inf

3. From Ease desktop, install CHGRES programme as application for SINGLE tasking and assign favourite key to it (e.g. F1)

4. All done! Press F1 from ease to call up resolution selector, choose and bang! Straight back to ease!

There is a slight disadvantage of this method, if any programme is set to run under single tasking then it returns to the Magic desktop after exiting, since ease is unloaded. Of course just hit ALT-R and enter will reload ease under forced res change, but perhaps there's another way to overcome this? I don't need to run anything under single tasking so it isnt much of a problem!

From: Rex Hebert <hebert@linknet.net>
Message-ID: <31774BDD.4CE6@linknet.net>
Source record: 146613

Hi all,

I'm servicing an Atari SC1224 monitor for a friend.
This is the one made by Goldstar with the controls on the right side.
Made in 1987. He says it just died one evening.

Can someone help me find a schematic.
I'm suspecting a flyback/high voltage block problem.
The power supply is good and the horizontal output is good.
The B+ supply is roughly 130V when disconnected from the main board
and gets pulled down to 55V when reconnected. No smoke or any sign
of burnt components anywhere.

Does anyone have an SC1224 that died for some reason other than
horizontal section failure that they might consider selling for parts?

> pages is slightly different to our norm ?

I use Apex Media for creating GIF's, but of course that's Falcon only. On an ST you could try TruePaint, or possibly you could use Spectrum 512, and then convert the graphics with ImageCopy or GEM-View...

As for the special formats, regular GIF's work fine, but there are two tricks you can use which make them better for using in Web pages. The first one is transparency. You can specify one of the 256 colours as see-through, which means you don't have to have just square blocks for graphics, you can have all sorts of interesting shapes! :) The second trick in interlacing. This is really only used in Netscape, when you see an image load progressively on the screen. Even though they're quite flashy, interlaced GIF's don't compress quite as well as non-interlaced ones.

ImageCopy 4 is you best (only?) bet to convert GIF's into the transparent or interlaced varieties - you can also crop you image to the size you want too! Well worth the money!

Cheers,

Neil.

Here is a problem i have using STiK and CAB: STiK dials the number of my Internet provider and connects succesfully. Then i load CAB and try to open a URL. It says "resolving host" and after a minute or two, it stops resolving and it opens a window with nothing in it! However, a friend goes further with his ST.
His ST says "resolving host", then "connecting to host" and then "receiving data 0/0" and then it crashes and goes back to the desktop. He tries to open again the same URL but it doesn't open it. He uses an old ST with TOS 1.4. I use a MEGA ST. We both use STik 1.8 and CAB 1.1. We tried using previous versions of STiK and CAB and the same things happened.
Please tell me what to do. I would be grateful for some help. :-(

Yes, I've had no problems with these pages... you aren't added the full stop
at the end of the address are you?

There is a link to these pages (which works for me) from my 'external links'
page...

>if it's not workable on the TT, would anyone be willing to port it over?

Yes, Bad Mood does use the DSP. It also runs in true-colour mode... It
would take a *lot* of work to port the DSP code over to 680x0, as this is
the main 3d rendering engine (not the drawing code though), but it might
be possible...

What about the cookie jar? Any programs can tell whether I have installed an FX
card (for example) by looking for the 'BLFX' (or something) in the cookie jar.
Most drivers for hardware mods install a cookie, dont they?

Also, Doesn't the VDI (or is it the AES?) tell you the screen size/depth when
you initialise it? You can use this as a guide...

>In the broader sense of resolution independence, a program should be able to
>run on an ST, TT or Falcon in any resolution... that's true.

Yep.

Falcon for sale!
Falcon for sale!

Will take best offer

4megs ram
Encased in Wizzatronics Rack mount case
Lastest tos version
will throw in neodesk and geneva
PC emulator
cubase 3.0 + key
ram expansion board

can buy all together or indiviually

Please E mail me xcen@shiva. hunter.cuny.edu
for bids I would like to start the biding
around $400.00

or call me at 212 - 663 - 1088

This is the best money saving buy yet

>toswin_30.prg is run to handle toswin
>
>no other programs are run to start a desktop or anything else (I assume that
>xaaes.tos takes care of 'gem' startup)

Yes, The XaAES menu and desktop (background - no icons etc.) should come up.

>Will I need to run a desktop? If yes, can one be recommended (I know thing
>v1.0 is now in english)

You will need either a shell (eg. sh) in a toswin-window, or a desktop
to run any programs...

I use Thing 0.59, and also have bash running, but I believe that various
other desktops work ok as well...

>TIA for your help on this one...XaAES sounds promising

Yep, it does. :)

From: kcclaess@cs.ruu.nl
Message-ID: <4l81jr$qh9@krant.cs.ruu.nl>
Source record: 146625
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.programmer

Gerry O'Rourke wrote:

(about MROS, a midi-operating system)

| From what I remember, MROS (Midi Real-time Operating System) was developed
| by Steinberg to allow more than one midi related program to run
| simultaneously on the ST.

I thought that MROS was a system that reads (and outputs) midi-events
above all things that happen on the ST.

| This means that only Steinberg will have the information/developers DOCS.

I tried to contact them, but nothing happened.

| You don't need MROS to write Midi programs for the ST, many good Midi
| sequencers were produced before its appearance.

Yes, but my efforts were too slow. I thought, with MROS, I didn't have to
care anymore about midi-events being read at the right time, because MROS
would do it for me.

| 1. If you are writing a sequencer or system exclusive handler & you find
| that bytes are being lost, you may need to increase the buffer.

| 2. There are problems with the Midi port & Keyboard; I think they share
| the same interrupt, some programs install a new keyboard driver.

I didn't have any of these problems, but thanks anyway!

Regards,
Koen.

Possible solutions:
1. Start your ST without a disk in the drive. The disk will spin for about a
minute, and then an empty desktop should appear. Then you can format a
disk (watch out for lost data!).
2. If you know someone with a PC, go there and format a DD disk on that
system. Your ST should have no problems reading that disk.
3. Buy a batch of `DOS-formatted' DD disks. Although they might be hard
to find.

First, try running MiNT without the memory protection. Simply rename
mint.prg to mintnp.prg. Then the video problem, I ran to the same
problem. But I got it working by loading XaAES from Desktop, and
not putting it in the INIT.. so edit the MINT.CNF and remove
the INITs etc. so that desktop loads. Then launch XaAES from
desktop. Worked for me a OK.

>Will I need to run a desktop? If yes, can one be recommended (I know thing

Not necessarily.

>TIA for your help on this one...XaAES sounds promising

Yes it does, but seeing it in action might be a bit depressing if
you're expecting too much from the alpha versions :-).

How? I am *very* interested to hear and order a product to increase RAM
above 4Mb on a Mega STe

RV> Since it was used, i do not know how the anhancement was made; as far

Bugger. I suppose this prevents use with a graphics card plugged into the VME... unless there's some kind of throughport facility ?

RV> It works with almost all programs (including games etc.) Only the

Why not?

> Does anyone have any
> suggestions?

1. Switch off your computer and hard drive. Remove any disk from your
floppy drive.

2. Switch on the computer.

3. Insert a floppy disk and format it using the Desktop's format
option. Now you have a clean, uninfected disk.

-- or --

3.' Start up your terminal program and download your antivirus software.

I've got a TT. When I use any given serial port (ie modem 2) with any given program (in this case, Stalker) I have to reboot before any other program can use any other serial port. I have Ghostlink, which finally gives my doorstop of a 486 some use, but if I use it, I have to reboot to use stalker, and vice versa. Same with Stik, although if I use stik first, I can use stalker after, but not vice versa.

Any ideas?

1341. ST stuff for sale

Atari stuff for sale. i bought a pentium so I would like to sell this stuff.
If you want EVERYTHING, the price can be negotiated. Please send e-mail
requests. I reserve the right to reject any offer. Buyer pays shipping, COD
required without money order/cashiers check. NO PERSONNAL CHECKS.

Atari hardware:
Atari 520STM, 2.5M, JRI 4096 color board, TOS 1.4 $125
2 DSDD Disk drives(external) $30/each($50/pair)
1 80MB SCSI harddisk(external), with Supra controller $80
1 14.4k Practical Peripherals modem(external) $25
1 atari RGB color monitor $65
1 atari mono monitor $50

all hardware in orig package with exception of mono monitor and modem.
***hardware package-$325

Atari Books:

All software is original and works just fine. All software include manuals.
Price is $5.00 each software item. All of the software below for $150.
If you buy all of the software below, will throw in approx 200 PD/magazine
disks free(or will sell all of the PD/magazine disks for $20).
Word-Up 3.0
Assempro
Legend of Faerghail
Shadow Sorcerer
Demons Winter
Gunship
Speedo GDOS
Borodino
Fiendish Freddy's Big Top O' Fun
Carrier Command
Ballistix
The Killing Cloud
Braraccas
Gauntlet
Cadaver
Jug
Hyperdraw
Dragons of Flame
Nitro
The Third Courier
Wrath of the Demon
Slaygon

Forgotten Worlds
Goldrunner II
Lemmings
The Killing Game Show

You can turn off write verify, write a file then read it back
yourself. This is faster.

>I do know that I've done it with floppy disks, and the speed increase

I agree, although the method above can be used to good effect when
using programs like Fcopy etc.

>with no further instructions on how!

I had a look at the source code for setter.ttp supplied with hsmodem6
and although I could compile it easily, there doesn't seem to be an
viable method for simplifying it. There is a Gem program for doing it
and now I understand why that does not make things much easier. You'd
have to look at the docs for why, it's too involved to explain.

In the meantime, perhaps someone could help Tom with his TT settings?

[it was a TT wasn't it?]

I've seen this. It tries hard and is impressive compared to other
things I've seen but still it is not stable enough for my liking.

> and Guy suggests that a CLI acc. does/did exist somewhere.
>
> So what's the deal? CAN a console be run reliably forom an acc. with TOS
> 1.0 or not?

For once this isn't a shortcoming in TOS 1.0, it's common to all
accessories. Any memory they try to allocate does not belong to them,
it belongs to the main process. If the main process terminates then
this memory gets handed back. If this is the desktop then you usually
get away with it because it doesn't terminate. If you have a
replacement desktop or cause the acc to obtain memory whilst running a
program then you are in trouble.

I'm not a fan of accs myself so I've never tried this, but if you could fool TOS into thinking the acc is a process which is never going to terminate and do the allocation in the name of that process then it would probably work. I doubt this would be portable otherwise such a tool would already exist.

> Guy , do you remember the name of the old CLI or where it came from? If
> I can look at some code I may be able to do something with it...

It was years ago and possibly called CLI.ACC. I do remember that when you activated it, it switched to a TOS screen which it probably allocated on startup. Apart from not running in a window, it seemed to crash a lot as well. I can't even remember how it worked - it might even have been a CPM type thing. hmm - was it on one of the original disks?

> I'm not planning to multitask yet - I've only recently acquired my
> STf (*gasp*) and I'm keen to see how far I can stretch the little
> darlin' before upgrading!

When you do, think "MagiC", it can quite happily run TOS programs in windows. My ten year old MWC compiler quite happily multitasks in one, even with multiple copies of itself. :-)

1349. TT and Spectre/GCR

Newsgroup: comp.sys.atari.st
Date: 1996-04-19 00:00:00 UTC
From: <>
Message-ID: <4l8s6i$vfu@nw003.infi.net>
Source record: 146650

Has anyone out there used the Spectre/GCR Mac emulator with their TT? I have the info on the mod to increase floppy reliability but haven't done it yet. I was reading through the 3.0 manual addendum and noticed that it doesn't support the internal SCSI HD, that is a real pain. The 3.0 manual just keeps saying that all these great TT support features will be in 3.1, real soon now. I know that the company that made the Spectre/GCR went belly up but I was wondering if they ever released any of the newer code, maybe a beta or something. I really like the SPectre/GCR but I don't want to have to have an external drive just for it.

I second that! I find Hensa one of the very best Atari sites around- I've found the mailing list with info about new uploads extremely useful!!! (It's strange that no other site has picked this up). I really do hope someone else will continue supporting the Atari section.
Good luck with your next job Danny!

I know the feeling, but I hope this won't happen. You've put so much work into the whole archive, and I for one have appreciated your effort quite a bit! (I'm sure other have as well).

If nobody volunteers to take over, how about transferring the whole Atari section over to another FTP server? This was the person(s) taking over will already have a streamlined system (the docs that come with each file etc.) and can just continue in the same way with new files!

It's really saved me a lot of online time getting files, since with Hensa I know exactly where the file is, how big it is and what it does (as compared to guessing and wasting a lot of online time/money- possibly to find out that the file wasn't at that site after all!).

1352. New 1040 ST and Mega ST users... A little support.

Newsgroup: comp.sys.atari.st
Date: 1996-04-19 00:00:00 UTC
From: Michael Grove <mgrove@owens.ridgecrest.ca.us>
Message-ID: <Dq4oGC.Eux@ridgecrest.ca.us>
Source record: 146653

Hi all,

I have seen a few post lately from new users of the older ST machines.
I would like to offer the following items, for shipping charges only,
for your benifit. The software is the origonal package, not copies, and
will probably only run on TOS less than 1.62. Boxes and manuals included.
These items were either given to me or I purchased them at the Sacramento
Atari show for a $1.00.
Just reply e-mail to me with your address and I will ship U.P.S, shipping
charges COD. Or, less expensive, I will ship U.S. Mail and you can send
me a check (ya, I trust you :)

These items are not worth the shipping fees to ship outside the
U.S.A.

I will keep your address on file and notify all when more items become
available.

I hope this will inspire you to register someone's Atari shareware package :)

I ☐☐
To:gut swanpdog.
I think it was my original posting☐☐☐posting about hsmoda06
and the >TT that sparked this whole series. I have a TT and I think Tom has
a 1040 expanded. Not only are the docs a mess, but the GEM
program, setter.tos doesn't run in my computer. I do read a _little_
Berman, but it was still just a matter of trying various combos
of settings almost at rab☐ random before I found a set that works.
And about 6 csas posting that started another series about "Well,
it works on mine"
If the options were only in English, I wouldn't mind
typing j/n instead of y/n. But the options are in German and
only y/n-j/n are in English. This is worthless.
There are at least three separate documents, with parts in each.
you have to clip out the paragrafs, and [put them in order,
before you can make sense out of it. I THINK there is a option to
automatically transfer modem1 to modem 2, but I am not sure that is what
it does. That isn't described in ANY document.

I agree. From what Steve has said, it is Atari that is the hold up. The
Hawk is just an intro into the market they wish to establish. But, without
TOS, that would be almost next to impossible. (Even if Wizztronics is a part
of a much larger company :).

Source record: 146707

Boris D. Cahan (bdc2@po.CWRU.Edu) wrote:

: I had a minor but nagging problem with STiK that
: I partially solved last night, and thought I'd pass it along.
: I just got a used TT, and FINALLY figured out how to use HSmoda06
: (whose instructions really leave something to be desired!!!)
: so I could use the higher bauds on serial 2. So I went out and bought a
: new 28.8 modem, of course, to use with it.
: But, every time I tried to use stik, it told me that the
: modem was ONLINE, already!! I then had to click on "hang up modem"
: before STiK would run. A minor inconvenience, to be sure, but annoying
: anyway. Well it turns out the built-in default set of instructions was set
: for what a MAC needs, i.e. DTR is always asserted. So Stik thinks it's
: already on line.
: The problem was solved, or patched by putting at&c1 after ath,
: in the script. The original setting was &c0, which keeps the line high.
: (the MAC uses another line for DTR!) now when I disconnect at the end of
: a session, it really hangs up, and the modem light goes out.
: When I sign on again, STiK works fine.
: I hope this little note helps someone else, who doesn't even
: know there is a bug, or what to do about it.
: If anyone else had this problem, let me know, out of curiosity,☐.
: And if you have a more permanent fix.

To change this permanently, run a terminal program, enter the at&c1&w0
(the &w0 might be different if you're using other than a SupraModem, so
just enter whatever command it is that saves the configuration to the
NVRAM in your modem (another way to do it with a Supra is to type
at&f2&w0, which sets the configuration to one of three factory defaults -
&f2 is the one best suited for Atari machines)

Be well,
Leslie

1360. Iconify Under Magic 4

Newsgroup: comp.sys.atari.st
Date: 1996-04-19 00:00:00 UTC
From: phil@yeadontt.demon.co.uk
Message-ID: <37446307_OASIS_NEWS@yeadontt.demon.co.uk>
Source record: 146711
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.st.tech,demon.ip.support.atari

Does anyone know the value of the WM_ICONIFY variable given in the
Magic 4 hyper text documents.

I understand how to add the Icon gadget to the window title/move bar,
the GEM event message that signifies this item being selected and the GEM
event message recieved when a window is returned to full size. All I need to
know is HOW to iconify the window!

Rarther helpfully the docs gives the following example:-

```
wind_set(wind_handle, WM_ICONIFY, -1, -1, -1, -1)
```

I believe this call both shrinks and expands the window, but what is
the value of WM_ICONIFY!!!!

Thanks in advance for any help.

: I have TOS 4.04 with an external SCSI drive.
: Sometimes, when I'm on the Desktop, after opening some windows,
: the mouse remains as the busy bee, and the windows blink.
: I can still use the mouse to close window, and all is fine.
: But if I open a window, it happens again, and it is also
: hard to open the window(double click). It does that with all
: the drives, internal or external.
: It is pretty scary. Am I alone? What the hell is going on?
: Any suggestion?
: Bye..
: P.S: Or should I just call " THE GHOSTBUSTERS"

This problem happens on almost all Falcons including mine :-(. It is a bug in TOS 4.0x itself, that fills the keyboard buffer with the ESC command. What happens then if a directory window is open is that TOS refreshes the window contents by reading the disc drive directory ad-infinitum until the keyboard buffer empties or you close all open windows and hit a key to interrupt the bug that causes all the ESC 'keypresses' to happen. Sadly there is no way around this bug unless someone wants to write a bugfix to cure this one (hint? :-)). I have noticed that some software is more likely to set it off (esp. the older versions of the APEX media viewers when I look at pictures, FLI's etc...).

Ciao...

Hi there!!

I have had this problem too (not very often though). You could try this
to help fix it. If you run APEX from a desktop icon, make sure that you
close all windows before running it. I think that APEX gets confused when
the file selector is called and the last directory open on the desktop
(usually the top window) is not what APEX perhaps expects it to be. I
cant say why RGB works instead of VGA but maybe this will help on the VGA!!

Ciao, Chris W

Hello,

Yes the resolution independent Tempus version does exist (at least in
Europe) The latest version is AFAIK v2.25. I use this programm
regulary on my TT. Most of the time in TT-high but before I wrote this
message I've tested it with a Crazy Dots II graphics card in
640x480x16 and 1024x768x256. No problems at all.
Here back in Europe one can still buy this version for about 119 DM at

The next SwapMeet is Monday, May 6th, 1996.

ACE of America, an All Computers and Electronics User Group, with a special emphasis on Atari. At ACE Swap Meets you might find Atari, Apple, Macintosh, Commodore, Amiga, IBM & Clones, Nintendo, SNES, Sega Genesis, Jaguar, Game Boy, Game Gear and Lynx. You could also find the following items to go with your system, such as Printers, MoDeMs, Monitors, Hard Drives, Disk Drives, Power Supplies, MIDI Devices, Mice, Joysticks, CD Roms, Cables, supplies and Accessories.

ALL COMPUTERS, GAME MACHINES AND ELECTRONICS ARE WELCOME!!

ACE Is currently holding Monthly Swap Meets on the First Monday of each Month from 7 PM, except on certain Holidays that we must reschedule due to our facility being closed. Swap Meets are Held at 1819 NW Everett at the NW Service Center 3 Blocks North of the corner of 18th and W Burnside in Portland, Oregon. USA! Table space is $10. Tables provided as long as they last. Show up early to get a good table, like 6:30 PM.

FREE ADMISSIONFREE ADMISSION**FREE ADMISSION**FREE ADMISSION**

On the May 6th SwapMeet, we will be Raffling off a Panasonic Printer! Anyone showing up can win. Just be their for the Drawing. The first Ticket is ***FREE***! Additional Tickets are a Dollar each. This is One of Many good reasons to come to Our SwapMeets.

PLENTY OF FREE PARKINGEVERYONE WELCOME**PLENTY OF FREE PARKING**

FOR INFO CALL OUR SWAPMEET HOTLINE WITH 24 HOUR RECORDED INFO, CALL: (503)650-7196 OR FOR FURTHER INFO FROM BEN, INCLUDING TABLES: CALL FROM 3 PM - MIDNIGHT / MON-THU, FRI 3 PM - 6 PM: CALL BEN AT (503)256-9974!! IF BEN IS AWAY FROM THE PHONE, PLEASE LEAVE YOUR HOME NUMBER AND HE'LL TRY TO RETURN YOUR MESSAGE! THESE SWAP MEET SPONSORED BY ACE OF AMERICA!!

This Message is distributed throughout the Pacific NorthWest, everyone reading and their Brother is welcome to come and Attend!!

Please Direct all Replies to bensmith@teleport.com in E-Mail or call (503)650-7196 anytime.

The next SwapMeet is Monday, May 6th, 1996.

>Can anyone help? Guy?

I already posted a reply to this, has it gone walkabout? :-(

I'll just highlight this time .. :-)

It's beginning to look like there is a bug.

All the file operations are based round shel_read() which returns the
complete path and filename of the executable program. The code strips
off the filename then bases its operations around this path. Some TOS
versions have a broken shel_read() and only return the filename, so
the code had to use Dgetdrv() and Dgetpath() in this case.

I tested this under TOS 1.2 on a floppy and only the filename was
returned. As the alert prints the complete path it obtained it looks
like shel_read() on your TOS is returning I:SETUP.PRG.

The Dgetdrv(),Dgetpath() method is used if no ':' is found in the path
so it looks like this code is never getting a chance to run.

Try copying the folders SETUP\, CAB_OVL\, CAB\ and all their contents
to a floppy and run it from there. It is *just possible* that
shel_read() will not prepend <drive>: to a floppy file which means it
will start working.

Let me know asap which TOS version this is and if the floppy idea
works, otherwise I've got a major problem!

: pages is slightly different to our norm ?

Anything that can save in GIF format will work, such as True Paint,
Papillon, Prism Paint etc.

If you want to have transparent backgrounds (such as you see Everywhere),
I use IMAGE COPY 4 to convert them to GIF - interlaced - transparent
images. Its quite easy. Or if you want ready made images to use there are
several good sites to get them from. I can post them if you want.

: It's _another_ market to gain a monopoly in, dude. That's what Microsoft is
: best at! From Steve's perspective, if he had Microsoft support it would go
: a _long_ way toward insuring the survival of any computer line he launched.
:
: The cod you smell is that Steve may not be able to pull it off for a variety
: of reasons. They range from Atari setting an unreasonable price for TOS, to
: the difficulty Steve is having in finding 68030 capable programmers. Trying
: to bring a new machine to market is a _very_ big job!

First of all, I do not see a market for a new 68030 based computer. Using
a 68040 or 68060 or better a Power PC that might be different. Secondly, I
do not understand why it is so important to buy the rights to Ataris TOS.
Ataris TOS hasn't been worked on for almost three years now, and the time
that has passed has been used by other companies to develop TOS clones,
that are far more advanced and stable than Ataris TOS. Magic is in its
4th generation. Right now long WIN95 file names, multithreading and
background printing with an improved version of NVDI are being
implemented. N-AES has hit the streets some days ago. Being compatible
to Ataris AES 4.1, it beats Ataris product in terms of speed and
features by lightyears. So why doesn't that guy negotiate with those
german developers instead?

I thought I could perhaps write a little program to solve it. You'll
have to connect with that prg nd then enable STiK.
The problem is I don't know when STiK reads the DEFAULT.CFG-file. In
this file the IP# should be set by my program. If STiK reads it when
it is enabled, I can do something for you or else you'll have to wait
for an update on STiK...

The program I just talked about is finnished and seems to work.
It should be put in the AUTO-folder as this is the only way to let
STiK get the right IP-number.
E-mail me to get it UUENCODED. If someone would be so kind to put it
on hensa/umich/etc.!
I'm not entirely finnished yet, because I want to put a password-
protection in the program too, more specs can follow on demand!

Frits.
P.S. It's freeware!

Hi!

In article <massimo-1804961456560001@macmax.irfmn.mnegri.it>, massimo@irfmn.mnegri.it (Max Farina) writes:
#>How can I use long file names under MagiC4 and Gemini desktop ?
MagiC 4 supports external filesystems which may support long filenames, but the TOS/FAT-filesystems on your harddisk still only have 8+3. There's no MinixFS-driver available for MagiC, but the next update will have a VFAT-driver, which enables you to use Win95-filesystems with their (crappy) implentation of long filenames.

There will also be a Ramdisk-XFS for MagiC this month, but the docs are currently german only. This Ramdisk is fully dynamic and supports filenames up to 32 characters with distinction of upper and lower case.

Ciao

Thomas

Oops. Goof #34. (Memo to self: never post answers when you are half awake)

Sorry for the error.

>What about the cookie jar?

Not every ST is running a version of TOS which implements the cookie jar.

The system can tell which of the three native modes you're in, but I don't think any of the hardware hacks for overscan can report their existance back to the system software. That was my point about maintaining compatibility with ALL hardware.

BobR

Thank you, but you know I did it within 2 days, because a lot of people
wanted to get this version, I wanted to finnish this package but I had a
problem with the english importer. He wasn't and maybe still not agree
with the english version.

1395. Re: Can't Format Disks

Newsgroup: comp.sys.atari.st
Date: 1996-04-20 00:00:00 UTC
From: BobR <76702.1466@CompuServe.COM>
Message-ID: <4lb66hrbs1@mhadf.production.compuserve.com>
Source record: 146557

What the other replies are getting at is that a virus can't infect your ST until you try to load a floppy.

If you boot up with no floppy in the drive, there will be no virus in the system. You can then use the desktop format routines to format a brand new disk, which will have no virus on it.

The other replies also indicated that simply having a virus on the floppy, or in the system shouldn't prevent you from being able to download a program to an infected floppy. Then you would run the disinfection program you downloaded and clean the floppy (and any others you have that are infected).

Are you certain the problem IS a virus..?

The ST will simply ignore the extra bit. 1mb x 9 SIMMs work fine. I
have foour of 'em in my MSTe.

There is an IDE card available, but it costs as much as an ICD
AdSCSI+, which is the quintessential SCSI host adapter for the ST/STe.

The last word from David Small was that GBS went belly-up due to
legal battles, but he still owned the source code for Spectre
personally. He seemed to indicate that a version 3.1 would be forthcoming
that might allow running System 7. Unfortunately, Dave's message was
posted in April, 1995 and I haven't seen or heard anything about Spectre
since!

Simon@husbands.demon.co.uk (Simon Husbands) said:-

>Hey Guy....thanks for the advice. I'm having difficulty putting all
>that stuff onto one floppy though. Can I leave anything out (apart
>from the obvious foreign language stuff)?

Okay, try just copying SETUP\ to a floppy. There are three batchfiles,
SETUP.UK, SETUP.FR and SETUP.DE for english, french and german. I'll
assume you are installing the english one!

Contents of SETUP.UK ...

dat\uk\install.hlp install\pug.hlp
dat\uk\install.rsc install\install.rsc
pug.ovl install\pug.ovl
dat\uk\config.hlp config\pug.hlp
dat\uk\config.rsc config\config.rsc
pug.ovl config\pug.ovl
dat\uk\editor.hlp editor\pug.hlp
dat\uk\editor.rsc editor\editor.rsc
pug.ovl editor\pug.ovl
.\cab\rsc\cab_e.rsc ..\cab\cab.rsc
.\cab_ovl\cab.ovl ..\cab\cab.ovl

Just remove the last two lines with a simple text editor and save. The
SETUP\ folder is now independant of the rest of the www130 package.
Run setup.prg and if the bug does not raise its ugly head, it will
start copying files and automatically execute install.prg when it's
done copying.

Finger's crossed!

>I just saw 1.2a up there, but I have no idea what's new since none of the docs
>(german, english) mention it.. ??? Anyone have any ideas...

Here's the text taken from the docs to CAB v1.2a that I received this
morning from Joe Conner. Thanks Joe.

V1.2a (18.04.1996)

• Bugfix: When memory gets short CAB will free up less urgently
required memory (e.g. images in the cache RAM). Thanks to an
incorrect calculation this could lead to an endless loop.

• Print in colour is now also possible (so long as your GDOS
printer driver supports this).

• The absolute size in pixels (with tables or <HR>) are now
converted to the existing printer resolution on printing.

• OLGA protocol: CAB is a OLGA client

• First attempt at supporting JPEG images, the file CAB_JPEG.OVL
takes care of JPEG images and should reside in the CAB
directory.
Note: CAB.OVL is still required for on-line browsing, do not
rename either file!

Rich.

ntp= network time protocol

It facilitates syncronising of clocks via net. You dont operate it
or need to get it you merely query it to set your system clock.

What system you run will dictate how you do that (or indeed whether
you can do it)
.

Is there more information about this? I guess that SCSI drives are more
efficent, but are more expensive and not as common for IDE which are PC
standard BTW.

Yep, you're right !

> most of the qbove sort of questions are asked by beginners using an
> ST, not someone running MagiCMac (anybody else round here use MagiC
> Mac ???).

In fact, I'm using an ordinary 8MHz ST (bought in '87 and it's still
working :-) and for me it's absolutely sufficient !!!

At work I ordered a Mac with a PC-card inside. So I can use 3 systems
on a single machine. DOS/Windows, Mac and Atari !

> for God's sake does one do it.□????

Sorry, but RTFM !

In the document E_SCC.TXT is a discription which port does what
speed.
I don't have a TT, but I just read the manual for you :-)
It seems, that your TT has two further serial IO/ports
One named serial 2 and the other modem 2
serial 2 does 115kbaud, modem2 only 38400

And as far as I know, you don't have to make any changes to the
program via setter.ttp because all programs are "ready to run".

> CAN one get higher than 19.2 on an unmodified TT?

Not if you use modem 1 !

And you know why ?

That's just because most of the older programs are using methods to
acces TOS/GEM routines in way that isn't allowed. That's the problem.
One single direct jump/branch into the system-rom (just for example)
and the whole thing wraps up with a new ROM-TOS version.

In Msg A2168@B, egorf (egorf@delphi.com) wrote:

>I've tried everything from putting on the C drive to floppy to a
>different partition.

Put gdos.prg into the auto folder of your boot partition. When booting you should get a message on screen showing the version number and possibly the path as stated in <bootdrive>:\assign.sys. If you're still using Atari's GDOS v1.1 try to find AMC-GDOS which is a better version.

>I've altered the assign.sys file but it still won't work.

What did you alter? The first non-commented line (comments begin with a semi-colon ";") should contain the path to a directory where GDOS will find device drivers and fonts. Usually this directory is c:\gemsys but you can put it anywhere you want to. The path statement in assign.sys could look like this:-

path = c:\gemsys\

Then GDOS needs some information about the drivers available and the fonts assigned to each driver. Every driver statement starts with a number which specifies the device type. Then an option can be given (p = the driver is already in ROM, r = load the driver into memory residently). After this the actual driver name is specified.

Under each driver statement the available fonts are listed. On a standard ST this could look like this:-

```
01p screen.sys ; default resolution
atss10.fnt ; Sans Serif 10 pt
attr12.fnt ; Times Roman 12 pt
attp10.fnt ; Typewriter 10 pt

02p screen.sys ; low resolution
... ; fonts

03p screen.sys ; med resolution
... ; fonts

04p screen.sys ; high resolution
... ; fonts

21 deskjet.sys ; HP DeskJet driver
atss10ls.fnt ; Sans Serif 10 pt (laser printer)
attr12ls.fnt ; Times Roman 12 pt (laser printer)
attp10ls.fnt ; Typewriter 10 pt (laser printer)
```

```
22 fx80.sys ; Epson FX-80 compatible driver
atss10ep.fnt ; Sans Serif 10 pt (9-pin printer)

23 nb15.sys ; Star NB-15 compatible driver
attr12sp.fnt ; Times Roman 12 pt (24-pin printer)

As you can see, all the screen drivers are in ROM. The printer driver must be
in the directory specified in the path= line. Also, the fonts should be there.
Note that there are quite a lot of screen fonts but only few printer fonts. If
you need to print text via GDOS make sure to have the screen fonts and the
corresponding printer fonts installed.

Hope this helps,

-andre

>or do I still have the wrong type of SIMM?

Sadly it looks like your machine usses SIPS rather than SIMMS :(SIPP
to SIMM adaptors are available for only about $2 a pair so try
somewhere like Best or Toad to see if they have any but they are quite
rare nowadays I think.

> Vegard (vegard@interlink.no)

Well, the Mouse Systems A3 mouse works well--I'm using it right now. It's
an optical mouse with three buttons. The middle button does the same
thing as the left one under MagicMac, but when using Mac software all
three buttons can be programmed.

I have heard that the Logitech Mouseman and Trackman also work, but the
Kensington Turbo Mouse does *not*. Best to contact Toad Computers or
Systems Solutions for the latest info.

Its no rumor... It no longer exists unless Gordie Meyer decided to bring it back from the dead.

I was semi-involved with the project, contributing articles to the Atari United! Disk mag... As far as I know, there were only two or three editions of the mag. It went under for lack of interest in the community.

>Yes, you do need a seperate cable to hook SB's to MIDI keyboards but
>is it any different than using a DB-9 to DB-25 cable for modems?

YES! It's not just a little cable. It's a box. A box that will set you back the cost of a sound card, video card, floppy drive, network card (or two), a cheap scsi adapter or a 4x CDROM.

As I also said. It is not a simple thing to find either. One retailer in my area manages to carry it and that is still and Advanced Gravis version (presumably it would work with Creative cards).

As I said before. It is tantamount to saying that Atari has built-in SCSI because you can hook up a lynx to the ACSI port.

The timing may or may not be better or worse. However, saying that PC's have built in MIDI ports is misleading to say the least.

>
>As for software calls, the ST uses XBIOS which is exclusive to Atari
>computers while PC's need to have the Sound Blaster driver installed
>at boot up. But all computers are like this with using printers,

>end-user.

The only catch with this is that your extra examples are all generally integrated. (at the bios level)

Concievably one could make the same sort of box for a serial port (which might actually be a better idea) or a parallel port.

>>I just saw 1.2a up there, but I have no idea what's new since none of the docs
>(german, english) mention it.. ??? Anyone have any ideas...

You obviously didn't look hard enough! All the docs have been updated in
the docs folder - this appears to be the difference between 1.2a and 1.2,
where the updates were only in the German docs. If you wizz through to the
end of the txt file you'll find the history listing, which (surprise
surprise) tells you what's been changed/fixed/updated at each version,
including 1.2, naturally!

You sometimes have to look a little harder, but a quick check on the dates
of all the files is often a handy clue for the lazy investigator. It's all
there for you to read, I suggest you do that!

Andrew

CP>A german ATARI-Emulator is called JANUS ?????????
CP>Where I can request or order this program?

JANUS isnï¿½t a Programm. JANUS is an ISA Card. THis card integrated the
68000 (to 68020) processor an the TOS 2.06 and the ATARI RAM (2*SIM 70ns).
The IBM PC call the card with drivers. This is the reason why the JANUS
ist very compatibil.

CAn it be that you mean the GEMULATOR95? This is a software emulator, but
the performance is dependent on the IBM PC processor.

1431. Re: TT and Spectre/GCR

Newsgroup: comp.sys.atari.st
Date: 1996-04-20 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <4l9nm3$g5d@madeline.INS.CWRU.Edu>
Source record: 146733

I have a similar problem. My Spectre worked like a charm
on my 1040STf 4 MB, 16 MHz. I talked to a couple of people
who Use GCR with their TT, and it obviously works with some
including with the internal 1.44 drive. So I got rid of the

1040 and got a TT 4+4/1.44 + 720K ext.
Well Spectre works still, but I can NOT adjust
the GCR to read or write, no matter how I adjust the pot.
One of the fellows who uses the TT with a GCR sent me a "fix"
published by Gadgets, where one clips a lead and solders in a
spare 74LS04 piggybacked on another chip. This wasn't too tough,
but it didn't help either. It will almost read some prerecorded
disks I had from Microsoft and from AOL, but not quite. I use
Flutie (a PD program to examine floppies) and it gives me read
errors on about 10-20 sectors. When I try to format a new disk
it gets thru about 80% (down to the 8-9 sectors per track region)
and then quits, saying it didn't work.
It still reads Spectre disks, and the rest of the system
works, but NO GCR.
Some one told me the floppy needs "extra shielding"
whatever that is around the floppy. but how and where I don't know.
I also heard that with a 1.44, you have to READ a 720
disk before launching, to set the internal clock, but that doesn't
do it for me either.
A few months ago, I did get an e-mail from Dave Small, and he says
he is still working on it but it ain't ready YET. He hasn't answered
my last 4 letters.
Yes, it will not read the internal HD. If you do find anything me know, too. and POST IT!
When I run gcrtest.prg, It shows me an error on EVERY
sector, side 1 for drive A, and side 2 for drive B.
Boris D. Cahan
bdc2@po.cwru.edu

I was Just about to, post a similar plea for help.

1432. Help! ST-Guide and TT problems

Newsgroup: comp.sys.atari.st
Date: 1996-04-20 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <4l9ou8$h7t@madeline.INS.CWRU.Edu>
Source record: 146734

HEEEEEELP!
I just got a new (for me) TT, and got ST-Guide 1.39e
to use in it. But it won't work! At least not in drive C.

I use an ICD HD driver, and I can put ST-Guide.acc
in drive D:, where it runs like a champ.☐, cause I can boot from
any partition with ICD.But not in drive C:
I took everything, but I mean EVERYTHING out of C:,
reformatted it, copied in a new ICDBOOT.SYS and the accessory
and its two folders (guides, and st-guide). That's ALL.
when I try to run it, it loads the first page OK, but when I try to
get any other page, it FREEZES. Won't even reboot, except with
the reset button. The mouse doesn't move, nuffin'.
Yet with EXACTLY the same files on partition D:
it is a pussycat. I copied them from one partition to the other.
I downloaded another copy of the zip file, and same thing.
I tried running in other resolutions, and still nothing.
If I run it as a program (by changing .acc to .prg) it dies exactly the same same way. Both C; And D; are partitions on the same physical disk.
C: is 12 MB, and D: is 33 MB.
Has anyone else had this problem? It is driving me
CRAZY.
Programs can only call it, i gather when it is
an accessory, and I don't want to have to boot from D: all the time.

Boris D. Cahan
bdc2@po.cwru.edu

Source record: 146735

Oh, yes and one other thing. even with st-guide.acc just LOADED
and not run, It won't allow me to change resolution.
If, e.g., I click on preferences with it loaded, It halts with
TWO damn bombs.
So ST-Guide must be pissing all over some vector
or pointer in the OS. I tried changing the order of the accessories

but that didn't do a thing.

The ST can do that using Midi Music Maker - and MMM can play other
file formats, as well, which the SB MIDI simulator does badly.

David, just leave ALL disks out of the drive while booting - that will
give you a clean system to start with. After all, your OS is in ROM,
not on floppies.

Or, if you absolutely MUST create a boot disk to fulfill some twisted,
pathological need <G>, use an IBM PC with this command line:

FORMAT A: /F:720

And you can copy all the files and directories from an ST anti-virus
disk using

XCOPY A: A: /s/e/w

This requires MS-DOS, of course, and the ST disk MUST have those
critical 4 bytes set right in the boot sector in order for the PC to
recognize it as formatted.

If you'll use another terminal program, issue that AT&C1 and then send
AT&W to write the info to the NVRAM in the modem. After that, ATZ
should be enough to set the modem properly before dialing.

Hi John,

Are you sure about the resolution thing? I have version 2.21 (90 percent translated to English), and it runs in 1024x768 OK. Remember that this program will only work if it loads _and_ allocates ST RAM. I know version 2.1 did not work with the TT (and I suspect the Falcom may also have been a problem), because of memory addressing is different from the ST.

Great text editor though, I wish the word-wrap and line edit modes were easier to work with though!

Hope this helps...

Right. It's a hardware emulator, but there's an '020 version of it
for the speed-needers. Quite fast, if the specs from the advert are
anything to go by.

It was called Sudden View. Yes, it was quite impressive. Unfortunately the interface was a little too different for some people to like quickly. Also, since the screen writes were totally handled by the program (which allowed the speed you describe), I don't believe it worked in resolutions outside of ST med/high. For maximum speed in a more normal type of text
editor, I think Tempus is it. But for those dynamic screen drags, I agree that I've never seen anything on any platform that comes close.

Not to sound too repetitive, but it sounds like Edit Plus might be what you want (no fonts!!).
.or if you're very limited on RAM and have a stock sort of ST, then there's the little assembly language "Diary" that comes with Edit Plus and takes up about 20K of RAM.
(Yes, I'm biased, but I'm allowed, since I wrote the software.)

Hello Dave,

I'm pretty sure that Tempus v 2.25 works under all kind of resolutions
because I've tried it myself. It even runs in 640x480xTC.
AFAIK v2.25 is the latest version. It can be loaded into TT-RAM but it
can't be allocated to TT-RAM.
I use this version on my TT without any problems.
I've tried it under Geneva/Neodesk, Mint/Mintnet, Thing100
According to the readme file it should run under MagiC too

------------------------------------------------------------------------
SWEDISH ATARI USERS' ASSOCIATION (Svenska Atariklubben)
IN COOPERATION WITH NoCrew PRESENTS

-* THE NORDIC ATARI SHOW AND CONVENTION 1996 *-

WITH CONVENTION, EXHIBITION, SEMINARS,
DEMONSTRATIONS, CONTESTS ... AND MORE!

AT KORTEDALA GYMNASIUM IN GOTHENBURG, SWEDEN
ON THE 14th, 15th and 16th OF JUNE
------------------------------------------------------------------------
NOTE: The information in this text is not complete! Updates will come.

PRESENTATION

NAS was first arranged in 1995. It's a special show with a hacker convent,
exhibition and different seminars - all in one place.

This time the Nordic Atari Show is held in a school building, Kortedala
Gymnasium, in Gothenburg. It offers several small rooms for the hacker
contests and seminars, a big lecture hall for showing demos and films and a
normal size restaurant for the exhibition. Showers and dressing rooms are
available, and there is free carparking in the school area.

Pizza restaurant, cafe and other shops are only a few steps away from the
school. If you want to stay at a hotel please contact us for information
or visit our Webpage for details (http://www.tripnet.se/sak/nas).

Kortedala Gymnasium is fifteen to twenty minutes away from the central part
of Gothenburg. There are good possibilities for communications by tram or
car.

The dates are the 14th, 15th and 16th of June. Gather with your friends and
join us at a very fun and exciting show for Atari users around the northern
and european part of the world!

This year the exhibition and seminars are arranged by the Swedish Atari
Users' Association (Svenska Atariklubben), and the hacker convent by
NoCrew.

Below are all the activities, and the low entrance prices. Last year they
were a little bit high, but this year we hope it's suitable for all
wallets!

THE ACTIVITIES

For more detailed information see below.
```

exhibition
retailers and different associations will be there

hacker convent
competitions for FALCON, STE, ST and 8-bit

demonstrations
Jaguar, Lynx, MiNT, MagiC, Linux, DTP, Internet etc

seminars
about programming, Internet, multitasking etc

others
competitions for the non-programming experienced
(lottery, MidiMaze-contest, harddisk throwing, CocaCola-drinking etc)

THE PRICES

type payment SAK-member non-member

3-day entry prepaid SEK 100 SEK 125
3-day entry at the door SEK 125 SEK 150
1-day entry at the door SEK 50 SEK 75

The T-shirt is gasping yellow with a fine black print. Highest quality.
Don't miss this fantastic offer. Limited quantity.

T-shirt prepaid SEK 75 SEK 90
T-shirt at the door SEK 100 SEK 120

A cafeteria with low prices on CocaCola, Jolt, sandwiches, buns and
other tasty products will of course be available.

If you live in Sweden, you can order your tickets to NAS96 via
our Webpage at http://www.tripnet.se/sak/nas

Otherwise, if you live outside Sweden or don't have WWW access, and want to
order tickets to a lower price, please pay the right amount of money to our
Swedish postal giro account

nr 73 69 10 - 1

before the 31st of May 1996. Don't forget to state your name, address,
country, telephone, fax, email address and SAK membership nr so that we
know who's paying.

THE EXHIBITION

The exhibition will be open on the following times:

Friday 14th 12:00 -- 21:00
Saturday 15th 09:00 -- 21:00
Sunday 16th 09:00 -- 16:00

If you and your company or organisation wants to join the exhibition, then
estimate the space you need and pay the fee to us. We offer you different
sizes (measurements in Swedish meters) depending on your needs.

4,5 m2 costs 500 SEK
9,0 m2 costs 1000 SEK
18,0 m2 costs 2000 SEK

If you want more space, then every extra m2 is 150 SEK. Please contact us first to get further information.

The retailer's fee includes full entrance for two persons.

Nonprofit organisations can join the exhibition for free (with a space of 4,5 m2). This includes full entrance for one person.

Please pay at our Swedish postal giro account,

nr 73 69 10 - 1

before the 31st of May 1996.

State your company/organisation name, address, country, telephone, fax, email address, contact person and space needed. If you'd like to speak at a seminar about something, then tell us about it.

THE DEMONSTRATIONS

More will be added as soon as we get to know about them.

BBS We'll be showing STraight BBS, with products as Semper, LED, Octopus etc. Sysop Bertil Jagard will be answering questions and demonstrate different situations, as well as speaking about ethics and problems with communicating.

MagiC What is MagiC? What is multitasking? Find out by using MagiC 4, and swapping between those programs. Learn about problems and get tips from experienced users.

Making How can magazines be made with Calamus SL? We'll be showing how magazines the Swedish Atari Users' Association (Svenska Atariklubbens) with SL magazine "AtariMagasinet" is made. Tips, problems, features and possibility to make yourself some visit cards or other things to take home.

THE SEMINARS

More will be added as soon as we get to know about them.

Internet What is Internet and how can I use it with my Atari? Experienced administrators will be talking about Internet - history, how it's made, the future and more. We'll put it in reality too, with products for Atari computers that all of us can use - easy!

THE CONVENTION

NOTE: This is preliminary information. Updates will come.

Which computer? Atari in all forms. We want the hackers and the democoders. The Linux freaks. The MiNT people. The Jaguar nuts and everyone else that uses Atari in some form.

Demo contests

BIG ONE
No limit at all. Should be able to run on a Atari compatible computer
present on NAS96.

SMALL ONE
The limit is the shoesize squared (european) of the deliverer in bytes.

World cup in alfabutton

We will try to break the world record in typing a to z on a standard
keyboard. So far, way below two seconds. Go practise...

Films and demos

We will alternate between showing films and old demos on our big
screen projectors. Of course newer ones as well.

Prices

They will most certainly show up and be of good quality.
More info to come.

More information is available from larkov@tripnet.se, or visit NoCrew's
homepage at http://www.dd.chalmers.se/~f93labr/nocrew/index.html

FURTHER INFORMATION ABOUT NAS96

The best way to get new information is to join our NAS96 mailing-list.
Write to nas-users-request@tripnet.se and include the following in the
message text:

subscribe nas-users <your email address>

Our homepage is also informative to visit. It is at
http://www.tripnet.se/sak/nas and is updated whenever it is needed.

If you want more information about NAS96, then use any of the addresses or
telephone numbers below. Email is always the fastest way to get answers.

From: aa860@ccn.cs.dal.ca
Message-ID: <4ldb39$laf@apollo.isisnet.com>
Source record: 146505

A member of my user group has bought an HP Laser printer, after the sad demise of his Atari Laser. Now he needs to find a printer driver for his word processor of choice - Wordflair. He is currently using a 9 pin emulation somehow but would like to return to 300dpi glory!
Does anyone know if There is such a drivwer for Wordflair and if Wordflair is compatable with either Speedo or NVDI? Someone here suggested NVDI might have a driver for this printer.
Thanks.
Check out the game on my website - follow the link marked Dharma!

Ogg.: Re^3: HSMODEM ESCC megaSTE
---------[FidoNetmail]----------
In uno strano messaggio del 21 Feb 96 Harun Scheutzow (2:241/1063.100)
scrisse
al povero Mike De Petris:
MD>> We found the Zilog ESCC here in Italy but at different clock rates
HS> (8,16,20...) which is the right one ? Is 16MHz ok, also for clocking
at
MD>> 14....Hz ?
HS>
HS> Yes, 16 MHz. You may use XX MHz ESCC for every clock rate from 0 to XX
HS> MHz, that means 16 MHz ESCC will work even on 8 MHz.

Thanx, I have a problem here. I installed the ESCC in the TT and all is ok.
I
then installed it in my BBS, a MegaSTE:

- modem2 is ok with the modem at 38400

- serial2 is bad, it was better before. With the old SCC the serial2 was ok
at 57600 with just some retries even while the modem2 was busy with the
BBS, it seems there is no RTS/CTS handshake on both MSTE and TT now.

Please give me some hint.

I tryed with various configurations of HSmodem with Semper, Octopus,
GSZRZ...

1457. XaAES and the Falcon

Newsgroup: comp.sys.atari.st
Date: 1996-04-21 00:00:00 UTC
From: Billy D'Augustine <azog@worldnet.att.net>
Message-ID: <317A4B56.4372@worldnet.att.net>
Source record: 146509

Unfortunately, I cannot find the original message I am referring to, but it was posted within the last week.

The poster was looking for info on why XaAES doesn't work on his Falcon, and the symptoms talked about memory violations.

I've been playing with XaAES, and found some interesting things...
Firstly, if I run TOSWIN30.PRG from XAAES.CNF, I get the memory violation spoken about. Taking it out and things work fine. I try to trim everything out of any INF or CNF file that's beyond the "norm", and so far this works.

Another poster talks about turning off memory protection; ie: naming MINT.PRG to MINTNP.PRG. Now if I do this, and run TOSWIN30.PRG from XAAES.CNF, all works well.

However, that's not a good solution. The Falcon supports hardware memory protection, and in my head, turning it off only makes the system less than it should be.

Actually, Emagic announced at the most recent NAMM that Logic 2.5 would be available for the Atari soon, but that this would be the last update for the Atari. Hey, my Atari is great and has served me well throughout the years, but what I _make_ with the tools is far more important than the tools themselves (i.e. I make music, and whether I make it on an Atari, Mac, PC, SGI, C64 or whatever is really not relevant). If the tools I need are no longer available for one platform, i'll either make do with what I have or switch.

GENEVA/NEODESK 4 DON'T LIKE PAPYRUS/ATARIWORKS?

From: Brian-Roland Miller <brimiller@delphi.com>
Reply to: Brian-Roland Miller
Date: Sun, 21 Apr 96 03:15:00 -0500
Organization: Delphi (info@delphi.com email, 800-695-4005 voice)
Newsgroups:
comp.sys.atari.st
Reply to: newsgroup(s)

I'm running Speedo 4.1 along with NeoDesk 4 and Geneva. When loading
Papyrus, every time I attempt to open a document window, the window partially
draws, and the system locks up, without ever loading the document.

In AtariWorks, I get sporadic operation. If I have a document that contains
several fonts, and I attempt to open the font panel to select a new font,
everything's OK. However, if I am in a new document, or a document with
only one font, any attempt to open the font panel renders an empty panel
and system lockup requiring reboot.

Is the problem in Geneva? Speedo 4.1?

BR Miller
Boston, MA

Briam, I use Geneva4/Neodesk4 and run al the time Atari Works
with NVDI3 or Speedo 4 and I never hd any problems.

One important thing to remamber is to configure the memory flags
under Genava to make sure that the programs you are running don't
take all the available memory. These flags under the task manager
are very easy to set.

The other question is How much RAM you have in your computer?

Both Genava/Neodesk are very fine programs and I have even run
Multiple GEM programs with SoftPC DOS programs without
trouble.

Experiment with the managers flags and I am sure it will work.

I hope this helps. Raymond

PS. Geneva also run very well when I had 4 megs of RAM.

1462. Re: Can't Format Disks

Newsgroup: comp.sys.atari.st
Date: 1996-04-21 00:00:00 UTC

Message-ID: <4ldo6e$cqu@news.sas.ab.ca>
Source record: 146514

: What the other replies are getting at is that a virus can't infect your ST
: until you try to load a floppy.

Exactly. I can't find an uninfected floppy, and I can't format the
infected blank ones without loading them first.

: If you boot up with no floppy in the drive, there will be no virus in the
: system. You can then use the desktop format routines to format a brand new
: disk, which will have no virus on it.

But as soon as I load the disk, won't the system use getbpb() and load
the virus again? Or am I wrong? Maybe if I take a magnet to the disk...?

: The other replies also indicated that simply having a virus on the floppy,
: or in the system shouldn't prevent you from being able to download a program
: to an infected floppy. Then you would run the disinfection program you
: downloaded and clean the floppy (and any others you have that are infected).

Well, first I have to download the decompreession programs, then the
anti-v. I have little or no trouble doing that much, it's when I try to
decompress either archive file that the disk messes up on me.

: Are you certain the problem IS a virus..?

If it's not, then my disk drive is screwed. Any suggestions on that one?

Not much help - doesn't cure anything. :/

Easiest way to stop it is to select "open" from the desktop file menu, and
then press a key to interupt. Saves having to close all the windows.

Yours etc.

David.

Please tell me what to do. I would be grateful for some help. :-(

I am having the same problem as you are having. I'm about to give up on
solving it. I would like to use my Atari for www access, but now that I
have Macs available and they work easily for this, I can't really justify
spending more time trying to get Stik/CAB to work correctly.

1469. Antmail 0.7.5 released

Newsgroup: comp.sys.atari.st
Date: 1996-04-21 00:00:00 UTC
From: baldrick@terminator.rs.itd.umich.edu
Message-ID: <4le7or$hcj@lastactionhero.rs.itd.umich.edu>
Source record: 146521

Antmail 0.7.5 is now available on atar.iarchive.umich.edu in
atari/Network/Stik/ant7_5.zip.

Several improvements and bugfixes. Sucha as multiple deletes.

I'm know not all the bugs are gone yet. But delete is now
somewhat nicer. For details see the history.txt or the antmail.txt in
the archivwe.

Feel free to distrubute far and wide.

On another note. Those of you who have emailed me and not gotten
a reply.

First please mail me at ackerman.29@postbox.acs.ohio-state.edu I
will not only get it faster but it's easier for me to reply. So people
like Mario out there who have mailed me without getting a reply. Please
mail me at teh above address and I'll try and get back with you.

To those of you who have mailed me at the above address and not
gotten a reply. Very possible that it was lost while trying out a new
delete awhile back. Lost quite a bit of mail and I didn't follow my own
advice and back it up for I went to town on it. So if it was important
mail me again and I'll get back with you.

For those of you who have mailed me for Dev kits. Flinny has
been handling those up til now. We are going to work on getting a more
modern one put together. So if you can't get one from him, hold on and
we will try and get something better set up for you all.

Well I'm certain there is more that I could say but this is
getting long. Have fun and don't forget that some money might be nice :)

Dan
aka baldrick@terminator.rs.td.umcih.edu

>what I have or switch.

I agree, but another thing to keep in mind is that if the tools you're
using do the job it doesn't matter if it's not state of the art by today's
standards. I'm using Notator SL myself and even though there are several
more advanced programs available now for several platforms it does the job
more than well enough. In fact I know that I really haven't delved into
many of it's (rather powerful!) features, but merely scratched the surface.

So, for me I have no plans to switch platforms- at least not because of the
MIDI stuff I do. (Then again, a Mac would be nice for trying out all of the
new Internet stuff which we don't get on the ST). But my STe stays!

1474. Gemulator printing problem

Newsgroup: comp.sys.atari.st
Date: 1996-04-21 00:00:00 UTC
From: cpb4@ukc.ac.uk
Message-ID: <514@cypress.ukc.ac.uk>
Source record: 146526

Hi!

We have a small problem printing under Gemulator. We use Gemulator under Windows 95. The printer is a LaserJet 4 which is set up OK for Windows printing. When printing through Gemulator (with PageStream), each page will not print until the beginning of the next page is being sent to the printer. That is, we print a page, some data gets sent to the printer, but no page appears. If we send another page, the first page will print. If we press form feed to eject the page, only the top part of the page is printed.

I've experimented a bit, and, as far as I can tell, something in the system is buffering up data, and not printing it until the buffer is full. The block size seems to be about 1K. However, I can't tell whether it's Gemulator, Windows 95 or something else that's causing the problem, or how to cure it. Any ideas?

Thanks,

--Charles

I'm selling the latest Gemulator 4.xx

sits in your case (16 bit card) holds TOS 2.06 roms (included) and is
faster than a falcon (your machine influences this!)

Check out the WWW support site for Gemulator at

http://www.halcyon.com/brasoft/

It sells in the UK for ï¿½150, I want just 75 plus p&p

Get back to me if youre interested.

lwright@wintermute.awinc.com (Lawrence Wright) said:-

#I've got a TT. When I use any given serial port (ie modem 2) with any
#given program (in this case, Stalker) I have to reboot before any other
#program can use any other serial port. I have Ghostlink, which finally
#gives my doorstop of a 486 some use, but if I use it, I have to reboot to
#use stalker, and vice versa. Same with Stik, although if I use stik
#first, I can use stalker after, but not vice versa.

I've noticed the same thing myself on my TT and have not figured out why.
I can only guess the two programs are using different methods when
accessing the ports. For some reason I can switch back and forth from
Oasis 1.35E and STiK with no problems. STalker and STiK however is
a different story and I end up rebooting as you describe.

flori@stingbox.sb.sub.de barked in U.COMP.SYS.ATARI.ST on 20 Apr 1996:

>> I am going nuts. From the description in the half German,
>> half English docs, it SEEMS that the TT with hsmoda is capable
>> of HIGHER than 19.2 KBd. Is this really true and HOW,
>> for God's sake does one do it.□????
f>
f> Sorry, but RTFM !

Oh, very funny. I have HSmodem working, but the docs are less than
useless, thanks. I quote:

SCC.PRG, ESCC.PRG, ST_ESCC.PRG

(Note for the English reading people: The English version is appended on
the German, look for it!)

<SNIP>

(The most important parts translated from German to English on 1994-01-09
by Harun Scheutzow. I have no time for translating all. If anybody
translates the remaining parts, I'm very interested in getting the result
for including it in the next version of this package. My native language
is German, I think a person whos native language is English would do a
much better translation. Thanks! (Send only mails smaller than 16kbyte to
my email address.))

<END QUOTE>

Now, while I do appreciate what Harun HAS translated, more than 75imply
HASN'T been translated. It took me about 3 days of experimenting to get
Modem1-EMU working - and I wasn't even sure what it was for until I
laboriously read through the German (I do read German, slowly and badly).

So telling someone "RTFM" is real helpful. You'll fit in just FINE in the
PC world.

>
> Anyone know of an Atari St emulator for the PC ?

Yes. There are two that I know of. One is a hardware emulator
called Janus. Its a plug-in card. I've only heard about it and
can't vouch for its performance or compatibility although I heard it
works ok - its just expensive.

Then there's the GEMULATOR. Its a software emulator. I have it and
can attest to both its performance and compatibility. It works well
and runs quite fast on my Pentium 100 system. Currently it does not
support PC joysticks making many ST games a no go. It also has problems
with sound on my system and displays some weird problems with most
ST Low-res graphics packages. Otherwise it works very well.

Its also cheaper than the Janus card and easier to update since its
a software emulator.

If you're running UNIX on your PC there's also an ST emulator
called STON/X (or something like that). Don't knowmuch about this one.

Ari

Source record: 146541

Hi, there. I have a problem with my Alfa Data hand scanner for my atari (I am using Touchup as the main scanner progam). It does not either scan properly (vertical stipes down scan) or even at all!.

Being a bit of an electronics hobbyist (and an electronic/electrical engineering student), I decided to check if there was a break in the cable which connects the scanner to the interface. Lo and behold there was!.

Anyway, to get to the point of this post.. I am not sure what kind of connector (that plugs into the interface cartridge)is on the end of the cable. It *looks* like an 8 pin mini-din plug, except that the middle pin is offset? If I new which kind it is I could easily fix my scanner!

Yes - Emagic will exchange dongles for a more TT compatible one, although
it's wise to phone and check first. I know someone who has done this and
Logic now works fine on their TT. Notator won't work, though, it's very
ST hardware dependant.

b> random before I found a set that works...

It may be that you've already changed the default settings so they now don't work. Let's see if I can sort you out.

SETTER.TTP *should* work unless it has become corrupted in some way. If you don't succeed using the following settings perhaps you could try downloading HSModem again just to be absolutely sure it's ok.

b> If the options were only in English, I wouldn't mind typing j/n instead
b> of y/n. But the options are in German and only y/n-j/n are in English.
b> This is worthless.

Hopefully you've noticed that there is english text toward the end of every TXT file. It's hardly perfect english, but it is just possible to wade through it.

b> I THINK there is an option to automatically transfer modem1 to modem 2,
b> but I am not sure that is what it does. That isn't described in ANY
b> document.

Yes. That's the M1EMU setting. It does work, sort of. I can get FzDT and Teddy Term to work from Modem 2 on my Mega STe, although not perfectly.

Despite the fact that I have a Mega STe rather than a TT I believe the following settings are valid.

Drop the SCC.PRG onto SETTER.TTP and respond as follows:

M2TT u ; default setting
M1EMU 1 ; allows programs that only see modem 1 to work with modem 2
LANBIT n ; unnecessary unless you use the LAN port
LANEXT n ; ditto
LAN_S2 n ; ditto
DTRM2 y ; default setting for modem 2 port
DTRS2 y ; default setting for serial 2 port (in case you ever use it)
M2DRI n ; only for the Mega STe - you may not see this option
RBLM2 16384 ; my buffer setting for receiving on modem 2 port

```
TBLM2 8192 ; my buffer setting for transmitting on modem 2 port
RBLS2 256 ; my buffer setting for receiving on serial 2 port
TBLS2 256 ; my buffer setting for transmitting on serial 2 port
Save y
```

Now, drop DRVIN.PRG followed by the modified SCC.PRG into your AUTO folder (in that order), ensure you're modem is connected to the modem 2 port and reboot. Go into your terminal program and change your settings to look at modem 2 (eg edit DEFAULT.CFG when using CAB/STiK to read " SERIALPORT = Modem 2" or select a higher baud rate in Connect or Semper or whatever).

Note that older programs don't have a setting for higher than 19200, nor a method of selecting one of the lower baud rates for remapping, so you're stuck - just get a new terminal if it's important to you.

That should work (I hope).

guy@swampdog.demon.co.uk wrote in Re: HSModa6 and TT?

g{ In the meantime, perhaps someone could help Tom with his
g{ TT settings?
g{
g{ [it was a TT wasn't it?]

Okay, here we go. Do all this and you should be able to run your Terminal Emulator program (Connect, Starcall, Flash II, Stalker,.... etc. -- even FreezeDried!) from your Serial 2 port on your TT.

First, make sure that XCONTROL.ACC is active. Make sure you have the MODEM.CPX. Run it and set the following:

For a 14.4 kBaud Modem, set the Baud rate to 134.
For a 28.8 KBaud Modem, set the Baud rate to 150.

(134 corresponds to a baud rate of 57600. 150 corresponds to a baud rate of 115200. 110 corresponds to abaud rate of 38400.)

Set the default port to Serial 2, and the other settings to whatever is appropriate for your server (8 bits, 1 stop bit, No parity, and RTS/CTS handshaking).

Next, use a Text Editor like Everest or Edith to open the DEFAULT.CFG file that is residing in the STIK_CFG folder on your Boot Partition (Drive C:\ if you have a hard disk, and with a TT you should have a hard disk...). With the Text Editor change the SERIALPORT setting so that it reads SERIALPORT = Serial 2. A little later, make the PKT_SIZE = 256, the DFB-SIZE = 512, and the RCV_WND = 4096. You can play around with these last three settings - try to get some help from your ISP as to what will work best with your particular server.
Save and close.

Open DIAL.SCR in the text editor and change the BAUD_RATE setting so that it reads BAUD_RATE = 57600, if you are using a 14.4 kBaud Modem and set the MODEM.CPX accordingly (to 134, see above). If you are using a 28.8 kBaud Modem, set the BAUD_RATE = 115200 (MODEM.CPX baud rate set to 150).
Save and close.

Whew! Still with me? Now lets install and set up HSMODEM06.

From the HSMODEM06 package of files, copy DRVIN.PRG, SCC.PRG and MFP_TT.PRG into your AUTO folder (now folks, this is for a TT only, okay?). Using AUTOSORT.PRG or some other method whereby you can change the booting order of the programs in your AUTO folder, arrange the files so that the last three files to run are DRVIN, SCC, and MFP_TT -- in that

order. On the GEM desktop, open two windows -- one showing the contents of your C:\AUTO\ folder, and the other showing the contents of the HSMODEM06 folder, showing SETTER.TTP. I've found that using the .TTP program rather than the GEMified version is a little easier on a TOS 3.0x machine.

With the mouse, click on and drag the DRVIN.PRG file from your AUTO folder over and on top of the SETTER.TTP listing/icon. SETTER.TTP will run automatically. Set the following:

FAST_INT, blah, blah, auf Deutsch..... Yes
EX_OPEN..... No

It will ask you next whether you want to save, and you should say YES. SETTER.TTP will save and close.

Next, drag SCC.PRG overtop of SETTER.PRG. Set the following:

M2TT - u
M1IMU - u
LANBIT - No
LANEXT - No
LANS2 - u
DTRM2 - Yes
DTRS2 - Yes
M2DR1 - No
RBLM2 - 256
TBLM2 - 256
RBLS2 - 256
TBLS2 - 256

Save and close.

Next, drag MFP_TT.PRG overtop of SETTER.PRG. Set the following:

RSVE - Yes
HISP - Yes
REPL - set all six of these to "u"
RBL - 256
TBL - 256

Save and close.

Last but not least, go into your terminal program and see if there is a page or menu item for configuring your RS 232 port or your modem. Depending on the program, you may be able to select the actual baud rate you want, 57600 or 115200 Baud, or you will just have to select the fastest one. FreezeDried is a good example of the latter arrangement -- you can only select 19200, but since you have reset the default baud rate with the MODEM.CPX, it will run at the faster speed. Same deal goes for selecting the port - set it if you can, otherwise, rely on the CPX that has set the default to SERIAL 2.

There you go.

Now before all you you start emailing me, telling me that my HSMODEM settings are wrong, or crazy, or whatever, I'd just like to say this:

I'm not a programmer. I have no idea what the heck these codes actually do. I have been able to piece together a configuration that works on my TT030, TOS 3.06 (yes, another machine from the sale) with the help of some very knowledgable people in the Toronto Atari Federation, notably Howard Carson and Steve Demetrius, the default configuration of HSMODEM06 that accompanied STARCALL, and some digging through my German-English Dictionary. Currently, I can run STARCALL (demo), FreezeDried, and STIK/CAB -- all through my Serial 2 port.

Hope this helps somebody out.

1497. Help! Falcon joystick port problem!

Newsgroup: comp.sys.atari.st
Date: 1996-04-21 00:00:00 UTC
From: Brian-Roland Miller <brimiller@delphi.com>
Message-ID: <5pDLf-D.brimiller@delphi.com>
Source record: 146595

My Falcon 030/4 has a highly vexing problem that is driving me up a wall. Though it works fine for productivity, whenever I load a game of any sort that recognizes the second joystick port (the one under the keyboard), apparently, the computer thinks that the joystick is plugged in and sending a "go right" signal. Regardless of whether a joystick is plugged in, loading a game results in the character going ZIP - off to the right, as though the joystick was telling it to.

I am at wit's end. Even though I primarily use my Falcon for productivity, the inability to play games is annoying. (and yes, I have made sure that no pins are contacting other pins.)

1498. Geneva/NeoDesk 4 don't like Papyrus/AtariWorks?

Newsgroup: comp.sys.atari.st
Date: 1996-04-21 00:00:00 UTC
From: Brian-Roland Miller <brimiller@delphi.com>
Message-ID: <5pMoHbE.brimiller@delphi.com>
Source record: 146596

I'm running Speedo 4.1 along with NeoDesk 4 and Geneva. When loading
Papyrus, every time I attempt to open a document window, the window partially
draws, and the system locks up, without ever loading the document.

In AtariWorks, I get sporadic operation. If I have a document that contains
several fonts, and I attempt to open the font panel to select a new font,
everything's OK. However, if I am in a new document, or a document with
only one font, any attempt to open the font panel renders an empty panel
and system lockup requiring reboot.

Is the problem in Geneva? Speedo 4.1?

Source record: 146598

Hi guys

I wonder if you can help...
The kids have been a bit heavy handed with the machine lately and have knocked the clock module that is plugged into the cart port. The clock still works ok but I would like to move it inside the STe case. I've been looking around for either a chunk of circuit board that I could solder some ribbon cable to or some cart port extenders.
It seems that nobody makes boards with the same size connections and that the extenders are nearly 30gbp !!!
Now heres where you can help... have you one of the following that you are willing to sell/give

1) cart port extender
2) an old clock module (that I could cut down)
3) any other old cartridge " " " " "
4) a chunk board that I could use to fit the port.

Thanks for your help

Hello

AFAIK DMC Germany has sold their rights to a Canadian company (MGI
Software Corp.) but DMC Germany will further develope the Atari and
Mac version of Calamus SL. In fact they are right now working on an
update of the German SL version. MGI will doing the developement of
the Windows version.

IMHO I think you must search the faulth in Speedo 4.1.
I've just tried a Papyrus 4 demo version under
Geneva/Neodesk4/Mint/NVDI 3.01. It seems that it works ok.

Replaced by a dedicated Cubase system.

>Now I understand that Calamus is also gone !! Never will we see another
>update of a truly GREAT program. Again, its a legend now but what of the
>future ?

DAS Layout was so far ahead of Calamus at the time of the MGI purchase that
I'm sure they decided to go the PC route rather than update SL for TOS. A
great shame, since I use and enjoy Calamus, but I cannot say I'm surprised.
I am awaiting, with amusement, for PC users to label Calamus as another
reason why people shouldn't use anything other than Windoze, though.

>Now to rub salt in an already deep wound I see that CYBERCUBE, makers of
>the Cyrel line of products, has been discontinuing their Atari products
>since the beginning of the year.

I had not heard this, but again, I am not surprised. CYReL products were
for VME-based TOS machines, which were few and far between. New graphics
cards have been popping up every day for TOS machines, and will probably
continue to do so. I couldn't afford $1500 for a Sunrize, anyway.

>How is it that this news doesn't reach us very quickly or was I sleeping.

<SMACK> WAKE UP!!!!! :')
Really, this sort of thing has gone on since the beginning of the TOS market.
I remember the moans of despair when PageSTream was discontinued and
Hybrid Arts went belly-up. New products like Calamus replaced the old ones,
and in turn, are being replaced by new products from a whole new generation
of TOS-based companies. It's called "evolution," and it's taking TOS in
some very exciting directions (what other market other than UNIX has
decentralized OS development in tandem with open hardware standards?)

1506. Award Winners Auction Update #2

Newsgroup: comp.sys.atari.st
Date: 1996-04-21 00:00:00 UTC
From: David Wyn Davies <101502.651@CompuServe.COM>
Message-ID: <4ld9cgnud1@mhadg.production.compuserve.com>
Source record: 146604
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,rec.games.video.atari,rec.games.video.classic,rec.games.video.marketplace

Here's a list of items available by auction.

Rules of this auction.

1. The auction will be open until midnight GMT on Sunday 28th April.
2. Buyer pays postage.
3. Goods will only be sent to the highest bidders once payment has been received.
4. Each bid should be in increments of 25p (50 cents).
5. All items have a minimum bid of 50p unless otherwise stated.
6. Payments should be made by cheques, bankers draft, International Money Order or cash. Careful with cash, though.
7. For cheque payments, please allow up to 7 days for clearance. Cheques only acceptable if drawn on UK bank accounts.
8. Sorry, but US collectors need to add $5 to the order value if sending cash to cover our own conversion costs. Other foreign nationals need to do something similar - please ask for rates.

Due to account problems with Compuserve, this is a re-running of a previous auction. The original bids placed still stand.

Current highest bids are at the right of each entry

Sure, the Gemulator by Branch Always Software. It's a combination of a
short slot card (w/6 TOS chip sockets) and software for your PC. It works
very well on a fast PC but I don't recommend it for games or MIDI apps.

HiSoft is doing the English version, but I don't know how far they are with
the translation of version 4. The translations take a bit longer this time
since the resource has to be redone due to added 3D effects and other
extensions. BTW Etilde is distributing the french Papyrus for a while now;
they should be ready with version 4 in a couple of weeks.

Does anybody know the weight of a stock 1040ST? I'd also be interested
how much the SM124 monitor brings on scale.

Many thanks in advance!

----O-O------ E-MAIL ADDRESS: ae490@cfn.cs.dal.ca ---|-|-------
-------------------- DARTMOUTH, NOVA SCOTIA --------O-O--------
----
A .DAT file is the answer to your post about using Warp 9 with Cubase. A
.DAT file specifies that certain of Warp 9's functions are turned off in
programs which have conflicts. In the case of Cubase, it is the
Extend-O-Save module whcich conflicts. You need to put the line
EXTENDO.OFF in a line by itself in your DAT file. No screensaver by the
screen acceleration etc. works fine with Cubase. For more specific info
on .DAT files refer to Appendix E of the Warp manual. Hope this helps...

More precisely, I built fixes for a few problems with Geneva into Papyrus since
version 3.60. You'll need an update of Papyrus, though older Papyrus versions may
work with Geneva 4.

I'm an old hat at the Atari ST, but know next to nil about hard drives. I have a 105 meg Quantum in a shoebox case that I bought about a hundred years ago and it's served me well, but now I'd like to put another one in the same shoebox (there's plenty of room). I paid over $400.00 for my current HD setup, and we all know how inexpensive they are now. Here's my question: I picked up a Computer Shopper and it has Quantum drives... it has a 1.02 GIG Quantum SCSI drive for under $300.00. Can I link that one in my case? Or even REPLACE the existing 105 megger with the GIG? I mean, is it true that "If it's a SCSI it'll work"? Is this too big for the ST to handle? Or even a 500 or so megger... will it work as long as it's a SCSI? And what if it's a SCSI-2, will that work?

1519. NVDI 4 - printing speed?

Newsgroup: comp.sys.atari.st
Date: 1996-04-22 00:00:00 UTC
From: Andre_Leistner@b.maus.de
Message-ID: <199604222157.a4322@b.maus.de>
Source record: 146417

In Msg A3936@B, Michael Clemmetsen (michael.clemmetsen@sunderland.ac.uk)
wrote:

>But it takes ages - over four minutes for a page. Is this normal? Is
>there any way to speed it up?

Which OS are you running? MagiC or TOS?

NVDI uses the normal GEMDOS functions for printing but unfortunately these are
pretty slow in all versions of TOS. MagiC comes with much faster printing
routines, so installing MagiC would help.

However, there is a way to speed up printing even under TOS. You could install
iPRN, a shareware auto folder program which replaces the original printing
routines with much faster ones. iPRN is written by Peter Missel
(peter_missel@a.maus.de).

Secondly, the printing speed is influenced by the printer driver setup. If the
driver is configured to print black and white only it should be fast. If it's
set to print greyscales or even true colour it will be a lot slower (especially
in true colour). This is due to the additional work that has to be done by NVDI
(dithering, separating colours, Gamma correction).

Thirdly, the amount of cache memory could be too small. If NVDI's font scaler
can't keep all needed character images in the cache it always has to re-scale
some characters. This could take some time which can be saved by increasing the
cache size.

In Msg A3978@B, Andrew Wright (aw@dial.pipex.com) wrote:

>There are basically two choices for emulating an Atari ST on a PC, the
>Gemulator and the Janus card.

A third choice has just been presented at the "Berlin By Byte" (Atari) show last weekend: MagiC-PC. That's the same MagiC as on Ataris and in MagiCMac. MagiC-PC is a pure software solution. Basically, it's an almost complete Atari ST emulator with a high degree of compatibility (even old TOS games run on it) which MagiC can run as an OS on. It needs win95 and reaches twice the speed of a TT on a 120 MHz Pentium-based notebook PC.

1528. M&E modular development system

Newsgroup: comp.sys.atari.st
Date: 1996-04-22 00:00:00 UTC
From: herve.piedvache@genesis8.frmug.fr.net
Message-ID: <8BF223D.00AD007B61.uuout@genesis8.frmug.fr.net>
Source record: 146426

M&E System

M&E is a modular development system. For the moment its activity is specific to graphical applications, but we are still working for a modular system on sound, and probably for text files in the future (help welcome).

M&E modules offer to load, get, save, export, warp pictures. It's divided in 3 most parts :
- RIM, for Reading IMage.
There is for the moment about 45 formats drived to load images files, classical ones like Degas, Neochrome, BMP, PCX, TGA, JPEG (with DSP Brainstorm driver), IFF, (X)IMG, ArtDirector, Spectrum512, etc. But there is also drivers for acquisition, which offer to drive peripherals like handy scanners (Atari Geek Port compatibles), Mustak Paragon A4 scanners, Numerical cameras (FotoMan, Kodak DC40), or video card like the Vidi-ST12. At last there is also 'Maker's RIM', which offer to make textures, grids or thinks like that ... what you really need for graphical applications is here !
- WIM, for Writing IMage.
Exactly the same things done for RIM. You save images in the formats you need ... or you can also drive peripherals like printers, and specialy color printers like Epson Stylus Color, Canon BJCxxxx, HPCxxx. We will work for Fargo photographic color printer in few time ...
-IFX, for Image eFfects.
IFX offer you to put specifics effects on images, like inversion, mathematical matrix, warping etc.

In the M&E package you can also find specifics modules for specifics works. In that way you have :
-Memory Manager.
Which offer to get a Memory management of you application really better than the original Malloc's ATARI one. With none memory fragmentation, with memory expansions (elastic memory) etc.
-TRM, for 'TRaMage', Dithering in French.
This module offer a real misc dithering operations features, with classicals dithering like Burke, or Floyd Steinberg, but also convertions for True Color to 256, 16, mono etc. As you want, all the time it can adapt an image on you screen resolution ! For the moment there is only 68000 dithering choices, but we are working for 68030 and DSP adaptations for quicker solutions.
-Drawing options
In the package there is also brushes, patterns etc. modules for people who want to use drawing options inside his software.

For the moment PARX company offer a complete development package in english or french for making modules, or driving them inside software. The kit have been done for C, and ASM languages at first, but some GFA Basic, and others

languages have some examples too. The development kit is completly free, but just need a licencee agreement which permit to the developer to get more updates informations on the package, also development support, modules updates, and confidential restrictions for geting a good orga nisation. That also offer to the developer to not doing twice what have been done before with a 45 developers teams on this system.

If you are interesting to be a M&E developer just contact us :

>
>Michael
>
>

Hi Michael,

I got a phone call from Chro_Magic's Gizzmo as soon as the add was posted :)
I admit that I have one of the first Keyboard Gizzmo's, and that a replacement
ROM is in the mail to correct my problem. The current (production) versions
do not exibit any of the abnomilies I mentioned.
If you have the DEKA setup like Wizztronics instructions, the Desk Topper will
fit just right, or you could use the KeyBoard Gizzmo.
I have a "16meg" card with all the simms on top. Clearance is no problem.
The Wizztronics ram card locates the 72pin simm on the underside.
I have a Might Sonic card installed and have had Expose on top of that :)
I had about 1/4" clearance.
What an I going to use? Mark X on order :)

Mike

> wind_set(wind_handle, WM_ICONIFY, -1, -1, -1, -1)

> I believe this call both shrinks and expands the window, but what is
>the value of WM_ICONIFY!!!!

(I think that should be WF_... etc. in the wind_set call, not WM_...)

Nope, it just shrinks the window. You use WF_UNICONIFY to bring it back
again.

Anyway, from the MAGX.H header file that comes with the programming docs:

#define WM_ICONIFY 34
#define WM_UNICONIFY 35
#define WM_ALLICONIFY 36

These are sent to you by the window manager (i.e. through evnt_multi()).
You then respond with wind_set() using the values:

#define WF_ICONIFY 26
#define WF_UNICONIFY 27

I believe I obtained the (German) programming documents from
ftp.uni-paderborn.de - look for mgx4doc.lzh

>the value of WM_ICONIFY!!!!

Well, wind_set() does both expand/shrink the window, but you also need WM_UNICONIFY and WM_ALLICONIFY [not sure about the lasts name].

I believe that WM_ICONIFY=25, WM_UNICONIFY=26 and WM_ALLICONIFY=27. I could very well be wrong, so I'm sure someone will correct me. (Try checking the GCC include files - I expect that these constants are defined there...)

The above info is for AES 4.1, but I believe that Magic handles it in the same way...

> chip. Mega STs, 520/1040 STEs, Mega STE, TTs and Falcons all had one.

<Fact>
TTs do not have a blitter.
</Fact>

> I never noticed the difference anyway.

The Blitter in my Mega ST (TOS 1.02) sped up graphics routines quite
noticably. It's screen redraws in ST-High monochrome were equivalent in
speed to the speed of my TT in ST High rez.

That's a bug in mount. For a workaround always specify an explicit type (-t minix) on the command line for mounts that aren't mentioned in /etc/fstab.

Andrew, after having downloaded both CAB v1.2 and v1.2a over the last week, I too was wondering what the differences were between the two packages. And you know what, I looked very hard at the docs that came with them - and strangely enough, I could find no mention of the changes. So even before I read your admirable advice, and then again after I had read it, I checked the docs that came with both downloads, and lo! and behold - they were identical, the same, no changes whatsoever. The dates and file lengths all the same!

Maybe you didn't obtain you files from Alex Clauss' homepages, and you were privy to a bit of updating that quite a few of us weren't ?

Yours,
Andrew

1538. Has anyone reverse engineered a "Team tap"?

Newsgroup: comp.sys.atari.st
Date: 1996-04-22 00:00:00 UTC
From: mbge4mdc@meehpb01.ee.man.ac.uk
Message-ID: <4lfo08$l4r@yama.mcc.ac.uk>
Source record: 146463

Yes I know this would be more appropriate in the Jaguar groups, but since there is the possibility of such devices being used on STes and Falcons I thought I'd ask here. I also don't get much time for the newsgroups, so it's all I can do to keep up with the three I'm already subscribed to!

Anyway, what I want to know is if anyone has reverse engineered a Jaguar "Teap tap" - the four player adaptor that comes with "White Men Can't Jump". I (as well as several other people, apparently) have already done the deed to a Joypad, but I'd like to know more about the team tap. I don't want to buy one, since I've heard that the game is quite poor, so I'd only really want it for experimentation on my Falcon and STe.

I assume that it fully decodes the "address" lines on the joypad. There are four lines, that are individually decoded for a joypad (i.e. one line, and only one line, is low at a time). I would guess that it is simply a demultiplexer which decodes the four lines fully into the possible sixteen codes - four joypads, each with four lines. Assuming this is correct (it's the most sensible way to do it), then I need to know which of the codes relates to which line on which joypad.

What I'd like to do is build up a bit of a resource of information about the extended joystick ports, so that anyone programming new games can use them to the full. Reading a joypad is quite well documented, but I'd like to eventually produce a document covering the construction and reading of all the options. I'm currently (on and off) working on a light pen, and tempest 2000 rotary controller.

Cheers in advance,

Xav

From: Michael Clemmetsen <michael.clemmetsen@sunderland.ac.uk>
Message-ID: <317B642A.594E@sunderland.ac.uk>
Source record: 146465

Hello Everyone,

I just got NVDI 4 and installed it on my Mega4.
I've tried it so far with the demo versions of Papyrus (3.62 and 4).

The printout quality on my Canon BJ-200ex using the default BJ-10e
driver is excellent. But it takes ages - over four minutes for a page.
Is this normal? Is there any way to speed it up?

Thanks,

Michael

1541. Thing Question

Newsgroup: comp.sys.atari.st

Source record: 146466

Hello,

Am I really thick or is there no way to do a disk copy in Thing?
Dragging floppy A over floppy B just copies all the files on A to B.

If Thing can't do it, does anyone know any good MiNT/MultiTos compatible
diskcopiers. All the old ones I used to use don't run with MiNT - mouse
pointer disappears, screen-redraws not done etc.

Thanks for any info,

Michael

In my head turning memory protection of on Falcon makes the system
more usable ;-). Because using memory protection 1) slows down the
system, 2) uses much more memory. And with multitasking systems
there isn't too much memory, especially when using 4 meg!
And in my experience MiNT works quite well without memory
protection too.

>
> Anyone know of an Atari St emulator for the PC ?

There are basically two choices for emulating an Atari ST on a PC, the Gemulator and the Janus card. Both require a free 16-bit ISA slot in the PC, both are driven by software. Gemulator 4 is cheapest and runs under Windows 95. Janus is very expensive I believe and not quite as flexible IMHO as standard resolutions aren't supported.

It's a C in a BINKLEY.EVT line, if I remember correctly (been a while since I last fidled with it!). I'm writing this at lunchtime from the office so if you'd care to drop me a note at my CiX address I'll send you a copy of my .EVT file and some explanations. You might also want to scour the Australian NeST/Atarinet boards for Dave Thomas's EVENTEDIT program which makes setting this file up a dream.

>Also in the Bink manual, it says I should use the NewNodeList statement
>for vers 6 nodelists......when i run Bink it says that it is an
>unknown command i've got vers 3.12 of Bink btw.

You don't need that command any more as Bink only uses a v6 or BTNC nodelist now. It's moved on a bit since the version you have, too. I'm running 3.17 at the moment. Bill Scull hatched a new version into the FAN network in the last week-ish so you should find that on Australian boards, too.

>which I'm not aware of any ports either).
>
Yes, I'm sure about the existance of a direct Fortran 77 Compiler by the
FSF, called g77. It's more efficient then the code wrapper f2c. Every
Linux distribution contains it, in most Unix magazines it ist used for
checking the SPECmarks (or was it the other benchmark which contained
lots of Fortran sources from theoretical physics?). As far as I know
g77 share some sources with gcc, you need both sources to make a
working version, which makes porting only possible for Falcon/TT or cross
compiler users.

f2c is ported. I got an old version, which caused problems whith my gcc
2.5.8 (undefined symbol __main, ...) I think most of the problems could
be easily solved by simple recompilation of the sources, which I don't
have. With some tricks even the obsolete version I got could work, but
I thought a real Fortran compiler would be much easier to work with.

Frank.

Sorry to correct you Andrew, but there are 3 choices. You can install
Linux on a PC, and then run STonX...

Both Linux and STonX are freeware...

So when can we get Logc 2.5 for the atari? I'm looking forward to it...
As for Calamus, well the latest version (last year) seems pretty recent and MGI software are still supporting it. THere's been quite a drop in price for the modules too, so now is the time to get them!
As for Cyrel, I've never had any dealings with them. They did support inshape, the sunrise cards and shareware progs such as Kandinsky and Gemview but as put before, the hardware is priced out of reach for most atari users. There are better grafix cards now available from nova and matrix systems.

Being dedicated to anything has its downs, especially computers! No-one can expect to have old technology supported forever, but it seems that despite the gloom in the atari world, a LOT of people are doing a LOT of work to keep good software arriving on the scene. We need to give them our support, start registering shareware more and keep the system alive.

Hi,
I had a similar problem! Essentially the TT has slightly different
timings on the cartridge port, EmagiC can obtain a TT compatible dongle
in exchange for your present one. Try contacting Sound Technology if your
in the UK.
The strange thing was that I changed the dongle several times and only
then realised that I had a problem with my cartridge port!

1558. Help! with st-guide and TT

Newsgroup: comp.sys.atari.st
Date: 1996-04-22 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <4lgb36$q9g@madeline.INS.CWRU.Edu>
Source record: 146483

Help! I am trying to run ST-Guide in a TT. When I load it from
the boot partition it dies after the first page. The mouse doesn't
move and I have to reboot. When I run it from partition D: it runs
fine. I even reformatted c: and loaded only ST-Guide, and it does the
same thing.

The same files in D: run fine. Any ideas?

> Does anyone know the value of the WM_ICONIFY variable given in the
>Magic 4 hyper text documents.
In PROFILE 2 I use the following code which works under MTOS but not tested
under Magic 4:

#define WM_ICONIFY34
#define WM_UNICONIFY35
#define WM_ALLICONIFY36

When handling your event messages:

short xc, yc, wc, hc;

case WM_ICONIFY:
wind_get(msg[3], WF_CURRXYWH, &xc, &yc, &wc, &hc);
graf_shrinkbox(msg[4], msg[5], msg[6], msg[7], xc, yc, wc, hc);
wind_set(msg[3], WF_ICONIFY, msg[4], msg[5], msg[6], msg[7]);
wptr->iconified = OPEN; /* set a flag to show state of window */
break;
case WM_UNICONIFY:
wind_get(msg[3], WF_CURRXYWH, &xc, &yc, &wc, &hc);
graf_growbox(xc, yc, wc, hc, msg[4], msg[5], msg[6], msg[7]);
wind_set(msg[3], WF_UNICONIFY, msg[4], msg[5], msg[6], msg[7]);
wptr->iconified = CLOSED; /* set a flag to show state of window */
break;

I just picked up a 1040STf (on the case) (fm on the sticker).
I need a mouse and some drive cable to external 354 drives I got as well.
A monitor is also need. I thought the FM's though had RF units on them
for use on the tv? Is there a FAQ available or pinouts so I could hook
it up to a SVGA monitor or something?

1563. Award Winners Auction Update #4

Newsgroup: comp.sys.atari.st
Date: 1996-04-22 00:00:00 UTC
From: David Wyn Davies <101502.651@CompuServe.COM>
Message-ID: <4lgi5upce1@mhadf.production.compuserve.com>
Source record: 146488
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,rec.games.video.atari,rec.games.video.classic,rec.games.video.marketplace

Here's a list of items available by auction.

Rules of this auction.

1. The auction will be open until midnight GMT on Sunday 28th April.
2. Buyer pays postage.
3. Goods will only be sent to the highest bidders once payment has been received.
4. Each bid should be in increments of 25p (50 cents).
5. All items have a minimum bid of 50p unless otherwise stated.
6. Payments should be made by cheques, bankers draft, International Money Order or cash. Careful with cash, though.
7. For cheque payments, please allow up to 7 days for clearance. Cheques only acceptable if drawn on UK bank accounts.
8. Sorry, but US collectors need to add $5 to the order value if sending cash to cover our own conversion costs. Other foreign nationals need to do something similar - please ask for rates.

Due to account problems with Compuserve, this is a re-running of a previous auction. The original bids placed still stand.

Current highest bids are at the right of each entry

NOTE: See end of list for wants. Only highest bidders at the end of the auction will be allowed to trade instead.

Atari 2600 Cartridges

>Is there anything I can do? The whole system seems to lock up after
>using vt52. Since I mostly use Oasis, it is often when exiting Everest
>after a Demon sesion.

I can elaborate on this somewhat ...

Under MagiC 2.0, I can run Nos 0.42 (directly) in a vt52 window.
Invariably, this works ok whilst Nos is running (though occasionally
not) but after it terminates, it will almost certainly lock up
immediately, and if it doesn't do it then, it will do it sometime
after.

iirc, Nos switches to an alternative screen. I have noticed that as it
starts, the screen will flicker in one of two ways (can't describe
it). One way, and it will be ok on termination (and lock later), the
other and it will lockup during use or immediately after termination.

As Nos also multitasks, there could be a conflict between it and
MagiC. Nos runs faultlessly in single mode.

There appear therefore, to be two possible problems ...

1) Nos and MagiC interfere with each other's multitasking.

2) The Nos screen switch interferes with VT52 (most probable).

>Any thoughts much appreciated...

If there is a way to get it to work then I'd really like to know as
well.

Yes you can. Turn the machine on without a disk in the drive. Wait
ages for the desktop to come up, then format it.

>: If you boot up with no floppy in the drive, there will be no virus in the
>: system. You can then use the desktop format routines to format a brand new
>: disk, which will have no virus on it.
>
>But as soon as I load the disk, won't the system use getbpb() and load
>the virus again? Or am I wrong? Maybe if I take a magnet to the disk...?

When the desktop comes up, just highlight drive A: then "format" it.
Don't open a window and it won't read the disk.

From: ae490@ccn.cs.dal.ca
Message-ID: <4lgidp$d94@apollo.isisnet.com>
Source record: 146499

I was wondering if anyone out there runs warp 9 and has had some problem with booting one program or another in particular? I am currently running the program on an Atari STE 1040 computer. You see, when I boot Cubase it freezes just as I touch the mouse after the main screen shows up. Then it says something about an error in a dialog box with a number below this statement. Whats the deal I wonder????... It boots up other programs just fine though!! I really like Warp 9 and want to use it with Cubase if at all possible. Oh, BTW, I also have TOS version 2.06 installed. Please help if you can... THANK YOU:-))))

>of things?

I forgot to mention vim. On the Linux system I have access to, elvis is the
default for vi, vim is also available, and I built nvi. Of the three of
them I like vim the best. I don't think I've ever heard of jove.

>>So anyway, to make it short, try vi. It's got a learning curve, and it

>
>Maybe I ought to give it a go, but I would prefer a GEM program - is there
>a GEMified version of any of the above editors? how about someone doing
>one? :-)

Nope. Hacker text editors like vi are directly opposed to WIMP [1]
interfaces. You might see about porting emacs instead - it runs on
character screens and under X-Windows, so there might already be a
GEM port.

Is it v4.11 R3?

Are you using FPrint or iPRN to accelerate printing?

I've used NVDI4 with CAB and have been v pleased with its turn of speed
using FPrint.

Unfortunately this is not possible. Dave was working at this, just before
the development stopped 8^(

An expansion for the mega-bus existed to add the localtalk ports, that's
all.

Please tell me what to do. I would be grateful for some help. :-(

I am having the same problem as you are having. I'm about to give up on
solving it. I would like to use my Atari for www access, but now that I
have Macs available and they work easily for this, I can't really justify
spending more time trying to get Stik/CAB to work correctly.
Paul

Well, friends I also had exactly the same problem.
I found two things that made it work. Try this as it works for me.

I use Stalker to connect because it enhables me to use the computer as it
is dialing. Once it connects I activate Stick and type the IP address.

For some reason this works all the time and not all the time when I
use Stik to connect. Also you may find it interesting that after you
made the connection and loaded CAB and AntMail if you reboot your
computer and activate Stik the programs still work on line.

I will include here my configuration as it really works. Remember
that I also had the problems you are having.

Make sure that STIKTSR.PRG is the last one loading from your
AUTO folder.

With this configuration CAB and Ant Mail work very well and CAB
is very solid.

Some of these parameters are not really necessary but it does not hurt
to have them there.

I just got e. mail from a friend from Grece that solved his problem
with this configuration. Please don't give up as it is really worth
it. :)

Source record: 146547

Boom! After years of not paying any attention to Atari computers (basically since my 130XE) I have an application that I'd like to use that requires an Atari ST. So, I start looking -- and geez, is this confusing.

The FAQ, supposedly in three parts, is nowhere to be found. I've checked every Atari archive that I can find out on the net, and I can't seem to find it at all. This hardware FAQ is key to me -- so I get what I want.

Now, of course, the bargain route here is to find a basic ST, learn how to use it, and then get started with my app. But, things are never so simple -- maybe I want to find a better computer than the original ST.

So, here's what I need to know. I visit Toad Computer's web page, since I've ordered Lynx stuff from them before. I find that the latest incarnation of the basic ST line is the 1040STE. It's 8Mhz 68000 (right?) and even though it has upgradable features, it's the basic ST.

4MB model is $529 from Toad. I already have a couple of SC1224s hanging around, so perhaps all I need is the computer. I'm sure I can get this for a better price used, since it was released in 1990. Anyone selling?

Also, since I'll be manipulating a fair amount of data and HDs are so cheap, I do want to be able to have a hard drive on the system. Can I do this with the STE?

Then, I go on to read about the MegaSTE. Faster, wow. All these neat things. Is it worth it? I don't know! Is it compatible at the higher speeds with all software?

TT pricing (as far as toad goes) is out of my range, but if they're in the market used at signifcantly lower prices, I might even be able to afford one. They're compatible, right?

What about 68000 accelerators for STE and Mega? Do they keep compatibility?

Also, TOS revisions -- what's the story? Is the highest TOS revision available for the 1040ST, Mega, STE, and MegaSTE different?

Any suggestions would be helpful! I'm just getting more and more confused...

The following items are for sale:

SM124 mono monitor 60 UKP

4Mb STe computer. Perfect working order. TOS 1.62. 160 UKP

VideoMaster digitiser and colour splitter for the Falcon. 60 UKP

Tape Streamer. 512Mb QIC mechanism with 11 150+250Mb tapes. 120 UKP.

MagiCMac 1.23, turn any Mac (68030 or better, or a PowerMac!) into an
Atari compatible mean machine. 70 UKP

Calligrapher Gold. WYSIWYG wordprocessor. 25 UKP.

Neodesk 3.02. Complete package including box and manual. 10 UKP.

Stereo Replay sampling cartridge for STFM or STe (boxed and as new).
20 UKP

Proflight flight simulator (for STFM, STe or TT, doesn't work on the Falcon
:-(10 UKP

Vidi-ST video digitiser, this is only the digitising cartridge and no
colour splitter so £20 is the suggested price.

View II, file viewing program. Designed for integration into the desktop.
Handles many file types (SEQ, pictures, samples, text, etc.) 8 UKP

Timeworks 2 plus two manuals on Desktop Publishing with it. 20 UKP
(inc. P+P).

Epson FX80 emulation cartridge for DeskJet, Deskjet+ and Deskjet 500.
20 UKP.

Printer Port buffer module, made by Paul Rossiter for HP Deskjet
owners. 10 UKP.

FontKit Plus 4, font editing package. 10 UKP

Redshift Astronomy CD-ROM with manual and box for PC or Macintosh.
15 UKP.

E-Mail me with any offers for items you may want.

Spencer

Source record: 146554
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello all,

I finally managed to get a working kernel on my Falcon, which does
not
have an FPU. I don't know if it can run every application, because
I've
only tested it with the ramdisk filesystem. So maybe it's not even
possible
to create your Linux partition on the HD..I havent tried that yet
but will next week.

But from what I've seen it runs pretty reliably:). When I used
'mount' on my Minix MiNT partition I got a 'Segmentation fault',
but I doubt if that
has anything to do with the FPU emulation code.

You can dowload the 1.2.13pl9 non-FPU kernel(only Atari support
compiled
in) and a new loader for the Atari from

http://www.esat.kuleuven.ac.be/~coene/files.html

1594. STIK & Hsmodem configuration

Newsgroup: comp.sys.atari.st
Date: 1996-04-23 00:00:00 UTC
From: Paul_Modos@mindlink.bc.ca
Message-ID: <85145-830278505@mindlink.bc.ca>
Source record: 146356

I have a 16 meg Falcon030 with no modifications.

I am using a USR 28,800 faxmodem.

In my Auto folder I have FPatch2, Drvin.prg, Scc.prg, Extendos.prg, Falcon8.prg(for Calamus), STfaxmngr.prg(sic?), Stikstr.prg in that order.

In Setter.ttp I made these "choices": M2TT=N, M1EMU=U, LANBIT=N, LANEXT=N, LAN_S2=U, DTRM2=Y, DTRS2=Y, RBLM2=256, TBLM2=256, RBLS2=256, TBLS2=256. That gave me the "prepared" SCC.prg driver that is now in my Auto folder.

Things seem to be functioning so far (I haven't ried going on-line with STIK yet)exept for the following: Right before I get the desktop (standard TOS 4.04) I get the message: "Invalid serial port|Using Modem 2". I have a stock Falcon exept for the 16meg RAM, so there is only one modem port.

Question: Is this OK?

Secondly, I also use STalker 3(I'm not shure if its the latest update, but I don't think so, because I get the stupid pop-up all the time). My modem reports a connection at 28,800 on the screen, but STalker's speed is limited to 19,200. At least, that is what it says when I'm downloading (~1800cps). This is all just text, I'm not using STIK & CAB on-line yet (one thing at a time!) Actually, my provider handily can accept a 19,200 login if neccessary.

Questions: What can I do to catch STalker up to the rest of the stuff? Will this cause jam-ups of any sort in the translation from 28,800 to 19,200.

Thank you all for your wisdom on these points. There will be more once I get into it more. Who knows? Maybe I'll be able to answer a few questions myself after a while of fooling around here. Rainy days-off aren't always so bad...

l8r&gr8r...

YIKES! out.

Hi ..

This is for all those people who don't know how to handle the
"setter.ttp" messages from hsmoda06.

First, the configuration of "drvin.prg":

```
-----------------------------------------------------------------------
> Konfigurator fr PRG/GTP/TOS/TTP nach Haruns Methode fr
> fremdkonfigurierte Programme. / Setter for programs.
> (C) Harun_Scheutzow@B.maus.de, 1994-05-07

> Bearbeite Programm / Work on program:
> C:\AUTO\DRVIN.PRG

> Informationstext / information text :
> FASTINT: Soll die Timerinterruptmodifikation fuer 57600Bd auf
> 8MHz-STs installiert werden?
> (Bei TT/Falcon kann es auch helfen.)
> Aktuelle Einstellung / current setting : Nein. / No.
> Eingeben: _J_a oder _N_ein. / enter: _Y_es or _N_o.

*** This setting is only for those people who want to try 57600 with
their 8 MHz Atari. With 38400 max speed this query should be
answered with N

> Informationstext / information text :
> EXOPEN: Sollen sich Gerte nur einmal ffnen lassen?
> Aktuelle Einstellung / current setting : Ja. / Yes.
> Eingeben: _J_a oder _N_ein. / enter: _Y_es or _N_o.

*** Should it be possible to use the serial port with more than one
program at the same time ... ?
Should be answered with Y because eg. a modem gets a little
confused (and some program too) if more than one program tries to
talk to it.

> Konfiguration beendet. / Configuration completed.
> ï¿½nderungen speichern / Save changes _J_a/_N_ein/_Y_es/_N_o?
> Einstellungen NICHT gespeichert. / Settings NOT saved.

*** That's it for DRVIN.PRG
-----------------------------------------------------------------------
```

Now for MFP.PRG

```
> Konfigurator fr PRG/GTP/TOS/TTP nach Haruns Methode fr
> fremdkonfigurierte Programme. / Setter for programs.
```

> (C) Harun_Scheutzow@B.maus.de, 1994-05-07

> Bearbeite Programm / Work on program:
> C:\AUTO\MFP.PRG

> Informationstext / information text :
> RSVE: Soll der RSVE-Cookie installiert werden?
> Aktuelle Einstellung / current setting : Nein. / No.
> Eingeben: _J_a oder _N_ein. / enter: _Y_es or _N_o.

*** Should MFP.PRG instal the RSVE cookie ?
Makes sense only if you have the RSVE (or compatible) hardware
installed

> Informationstext / information text :
> HISP: Sollen 115200/57600/38400 Baud den Fcntl TIOC?BAUD bekannt sein?
> (Passiert bei RSVE =Ja automatisch, ist aber auch fr RS_Speed sinnvoll.)
> Aktuelle Einstellung / current setting : Ja. / Yes.
> Eingeben: _J_a oder _N_ein. / enter: _Y_es or _N_o.

*** Don't know exactly, but if it's set, some programs (eg. CoMa)
allow acces to the above mentioned speeds.
ATTENTION: If this setting is set to yes and there's no serial
"speeder" installed, it's useless to set it to yes,
because the MFP can't do more than 19200 (except with
additional hardware !)

> Informationstext / information text :
> REPL: Falls Sie fr ein altes Programm die Baudraten
> 115200/57600/38400 noch auf andere Rsconf-Raten als
> legen wollen, geben Sie jeweils zuerst die alte, dann die neue
> hohe Rate ein. 3 Umbelegungen sind mglich.
> Aktuelle Einstellungen / current settings :
> Platz / place Nr.1 : ungltig / invalid
> Platz / place Nr.2 : ungltig / invalid
> Platz / place Nr.3 : ungltig / invalid
> Platz / place Nr.4 : ungltig / invalid
> Platz / place Nr.5 : ungltig / invalid
> Platz / place Nr.6 : ungltig / invalid

> Neue Werte eingeben, Platz ungltig markieren durch Eingabe von u.
> / Enter new values. Mark place invalid by input of u.
> Platz / place Nr.1 : u
> Platz / place Nr.2 : u
> Platz / place Nr.3 : u
> Platz / place Nr.4 : u
> Platz / place Nr.5 : u
> Platz / place Nr.6 : u

*** If you use programs wich are using 150/134/110 baud, you can
remap the higher baudrates to other speeds. (Is someone out there
who uses these speeds ? :-)
(Expl.: The higher speeds (38400, 57600 etc.) are mapped to 110,

134 etc. speeds. So if you select eg. 110, the port is in fact
set eg. to 38400). This works ONLY if you are using the RSVE
hardware-patch or equivalent.

> Informationstext / information text :
> DTR: Einstellung des DTR-Signals beim Treiberstart
> Ja = aktiv (wie bei TOS)
> Nein = inaktiv
> Aktuelle Einstellung / current setting : Nein. / No.
> Eingeben: _J_a oder _N_ein. / enter: _Y_es or _N_o.

*** Upon driver-init: Should the Data Terminal Ready Signal be aktive
(like TOS does it, but it's wrong, because no terminal is active)
or off, like it should be. All terminal programs are setting DTR
to activ upon start and inactiv if they are terminated.

> Informationstext / information text :
> RBL: Einstellung der Empfangspuffergre in Byte.
> Standard: 256, Minimum: 16, Maximum: 65534
> Aktuelle Einstellungen / current settings :
> Platz / place Nr.1 : 1024

> Neue Werte eingeben, Platz ungltig markieren durch Eingabe von u.
> / Enter new values. Mark place invalid by input of u.
>Platz / place Nr.1 : 1024

*** Receive buffer lenght. Should be set to more than 1024 Bytes (my
personal setting is 4096)

> Informationstext / information text :
> TBL: Einstellung der Sendepuffergre in Byte.
> Standard: 256, Minimum: 16, Maximum: 65534
> Aktuelle Einstellungen / current settings :
> Platz / place Nr.1 : 1024

> Neue Werte eingeben, Platz ungltig markieren durch Eingabe von u.
> / Enter new values. Mark place invalid by input of u.
>Platz / place Nr.1 : 1024

*** Transmit-buffer lenght. I think, 256 to 1024 are good numbers.

> Konfiguration beendet. / Configuration completed.
> ï¿½nderungen speichern / Save changes _J_a/_N_ein/_Y_es/_N_o?

Ok, that's it. Ain't that difficult ... :-)

1598. Falcon Info Please :-)

Newsgroup: comp.sys.atari.st
Date: 1996-04-23 00:00:00 UTC
From: tone@swoon.demon.co.uk
Message-ID: <830371206_OASIS_@swoon.demon.co.uk>
Source record: 146360

I`m hoping to get a Falcon RSN,but I want to know if it's possible to make a SCSI 2 to SCSI 1 cable as the ready made one's are a bit on the expensive side for what they are. I have the two small SCSI drives that I use with the STE,so I will most proberbly use those for now but disconect the host adaptor board and connect the SCSI together as before but with a SCSI connector at the end. If the SCSI 2 plug is not available then has any one got a cable for sale :-)

Also what software should I start getting hold of ? I understand there is a small program to boot from the external SCSI if there isn't a IDE fitted internally !

Thanks for any help :-)

Frank,

Do you have any more details on the "multiboard" that you could share with
us - availability? source? ?

TIA

1602. New TT has HD booting problem.

Newsgroup: comp.sys.atari.st
Date: 1996-04-23 00:00:00 UTC
From: aa728@FreeNet.Carleton.CA
Message-ID: <4lj7f2$pbs@freenet-news.carleton.ca>
Source record: 146364
Cross-posted to: ncf.sigs.atari,comp.sys.atari.st,comp.sys.atari.st.tech

My new TT (yes, a Don Thomas special) has a problem. When it's cold booted after being turned off for a while, it will not recognize the internal HD (a Seagate ST157N, 50 Meg). It boots to an ST low rez desktop with only a trash icon on it. Warm booting (CTRL-ALT-DEL) at that point will usually (more on this point later,) boot the TT from the hard drive. I thought it might be AHDI5 but I've installed AHDI6, same result.

Yes, I let the drive come up to speed before aborting the memory check. I've gotten the same results letting the mem check and boot delay terminate on its own.

I also have an 85 meg HD on the ACSI port using an ICD ADSCSI+ adapter (ICDBOOT V6.5.5) which was disabled when I used AHDI. Installing the ICD boot software on C: got me the same results as well.

If it was just that the TT needing to be warm booted on startup, I can live with that. The major problem is that the boot sector of the internal _sometimes_ get overwritten/currupted. that is what is reported by Atari's HDX. This makes drive C: totally disappear and the FAT on D gets messed up major. After this, booting from floppy, AHDI6 reports that unit 0 on the SCSI bus is 'unrecognized', Unit 0 on the ACSI bus is the 85meg Quantum, as it should be. I get the same (or similar) from ICDBOOT when booted from floppy.

I've been able to get things back by taking the Seagate off the SCSI bus and connecting it in place of the Quantum attached to the ICD adapter and booting from floppy. Sometimes running IDCHECK will recognize the drive and everything is back, sometime all I can do is re-format.

Any one have any ideas?

>I was hoping there would be a helpful FAQ about this, but no such
>luck.

Isn't there an "Apple File Exchange" or something? Whatever it is
called, use the software that allows you to access PC disks. Format a
PC 720K disk (DD DS 80 track, 9 sectors per track). The ST can read
and write to it. Best to use a proper DD disk as HD disks can be
unreliable and it saves you sticking tape over the HD detect hole.

I'll just take the opportunity here to remind people of the Nos
newsposting bug again as it's been a while:

If it's got a '%' sign in it, it'll get corrupted. This doesn't
matter (usually) for text but corrupts encoded stuff.

Fixes:

Email your stuff to the newserver if you can.

Get out a text editor, do a "search and replace" on it so that all
percent signs are doubled up.

Source record: 146373
Body handling: HTML body converted to readable text

Not that I really care to keep this going, but this is how the end of the
german docs looks on mine (the only file that lists v1.2a)..

V1.2a (16.04.1996)

y Bugfix: Bei Speichermangel versucht CAB, nicht dringend
bentigten Speicher (z.B. Bilder-Cache im RAM) wieder
freizugeben. Durch einen falsch berechneten Wert fr den noch
freien Speicher, konnte es zu einer Endlosschleife kommen.

V1.2b (19.04.1996)

y Die Angabe der Rnder fr's Drucken wurde nicht korrekt
ausgewertet, falls die Eingabe nicht 3-stellig war.

y Bugfix: CAB versucht Tabellen auch dann korrekt zu
formatieren, wenn ein
-Tag fehlt (funktioniert nur, falls

vorhanden ist). Wegen eines Bugs in CAB hatte das aber
bei geschachtelten Tabellen zu Fehlern gefhrt. Jetzt sollte
es wieder funktionieren.

y Farbdruck mit NVDI4 sollte jetzt eigentlich funktionieren.

y Bugfix: War der Schalter 'Vorgaben im Text benutzen'
(betrifft die Farben von Schrift und Fensterhintergrund)
nicht eingeschaltet, wurden auch keine Hintergrundbilder mehr
angezeigt. Jetzt sind beide Einstellungen unabhngig
voneinander.

If anyone can translate german.. The english docs only list up to 1.2. This
is from the cab12b.lzh archive on Alexander Clauss's home page..

: >(german, english) mention it.. ??? Anyone have any ideas...

: You obviously didn't look hard enough! All the docs have been updated in
: the docs folder - this appears to be the difference between 1.2a and 1.2,
: where the updates were only in the German docs. If you wizz through to the
: end of the txt file you'll find the history listing, which (surprise
: surprise) tells you what's been changed/fixed/updated at each version,
: _including_ 1.2, naturally!

: You sometimes have to look a little harder, but a quick check on the dates
: of all the files is often a handy clue for the lazy investigator. It's all
: there for you to read, I suggest you do that!

: Andrew

Except for 1.2a.. The docs indicated the update to 1.2 but not 1.2a.. (I had
updated from 1.2 to 1.2a that day).. Now 1.2b is out and the german docs have
the updates in there (1.2a and 1.2b) but I cant read german. :)

: >(german, english) mention it.. ??? Anyone have any ideas...

: Here's the text taken from the docs to CAB v1.2a that I received this
: morning from Joe Conner. Thanks Joe.

: *V1.2a (18.04.1996)*

: • Bugfix: When memory gets short CAB will free up less urgently
: required memory (e.g. images in the cache RAM). Thanks to an
: incorrect calculation this could lead to an endless loop.

: • Print in colour is now also possible (so long as your GDOS
: printer driver supports this).

: • The absolute size in pixels (with tables or <HR>) are now
: converted to the existing printer resolution on printing.

: • OLGA protocol: CAB is a OLGA client

: • First attempt at supporting JPEG images, the file CAB_JPEG.OVL
: takes care of JPEG images and should reside in the CAB
: directory.
: Note: CAB.OVL is still required for on-line browsing, do not
: rename either file!

In my doc file it is the same but says *V1.2 (10.04.1996)* at the top of the
message instead of 1.2a..

: use in Web Pages. Did I read some where that the GIF format in WEB
: pages is slightly different to our norm ?

WWW GIFs are the same, however you can use GIF89a (the newer format) to create transparent gifs - so you can see the background through part of the picture. I found some source code to a program that converts GIF87a files into transparent GIF89a's and recompiled it. If anyone wants it, I can put it up on my web page, but I lost the docs for it and didnt want to anger the author by distributing an Atari version. :)

Hi Katherine,

KLE>the file was corrupted anyway.

no, the file was OK. It works pretty fine on my Mega STE with MagiC 4. There are just some minor bugs in the RSC-File. For example, in 'Extra - Set up... - Desktop' I found '--%-- pattern:' instead of ' Desktop pattern:'. (Well, OK, this is the only one I found yet...)

But in general it works.

Greetings

Michael

If you have a Mac with System 7.04 or higher, or have PC-Mac transfer
then you may be able to use a DD disk formated as a DOS disk. I tried it
with a Power Mac and it works like a charm. Of course, if you're using
the school's Mac's then they may have some things disable. Hope this
helps...

Hi there,
A very common problem with Atari machines in general, is that the soldering of the mouse and joystick ports wears out and have to be re-soldered. Have caution when you open the keyboard, because there are LOTS of plastic things (one for each key) and they're all loose and can fall off very easily. Then you'll be searching for eternity for the one that's missing... Actually there should be one missing, as the CR-button has place for two and only one is there from the start.

Best regards,

Claes

I've asked Oregon Research about this and it seems that only SCSI-Zip's can be used. They've made SCSI-drivers for the Zip and the Jaz drives.

r> I am looking for an Atari Lazer Printer to use with my Atari 1040STe
r> computer. It would be nice to have it in completely working order too,
r> where would one get extra cartridges and other stuff that it needs to
r> print after it runs out?
You'll need at least 2 megs of memory if you want to do full-page stuff to
run an Atari laser printer as it uses the computer's memory to build the page
up before printing.

The SLM804 is probably not worth considering as it is obsolete, but the '604
shares the same print engine as the Mannesman Tally MT906 so the toners and
drums are easy to get.

Speak to 'ya later!

l>
l> Any ideas?

Are you using HSModem? What driver are you using - SCC.PRG on its own or
MFP.PRG too? Do you have M1EMU set up in SCC.PRG? If so, it disables
MFP.PRG entirely IIRC.

Some more info would help onwhat serial patch you actually use.

You're right about it not working with the Mega STe - I rang Marpet a few months back and they confirmed that for me as well as confirming that they wouldn't be working on it to make it compatible with the MSTe B^{<

I can't comment on the connections you mentioned, but I thought it worked on all STs below the MSTe.

Hi, Your problem was pretty interesting, so I reinstall my old speedogdos4.1
on the same configuration as yours. I just try it, to help you because I
never had those problems. Anyway..

Effectively I found the same problems as you said for Atari works.
Reponse: get NVDI, It is the best thing you can do for your computer, I
admit , it a little bit expensive, ($89) but you'll be very happy.

And about Papyrus I really don't know because I tried only with the demo
version , and it worked perfectly. So , I can't help you.
BTW, do you know that you can get free upgrades until neo4 release 5 ?
Bye.

>

There are two items with SCSI at your Atari ST wich are of importance.

First, your SCSI-controller in your shoebox has to support two or more drives.
If it relies on the SCSI-standard it has to support up to 7 SCSI devices.
If this is true, you can simple connect the second drive to the controller or
to the cable to the first drive. Address the second drive with a different SCSI-ID
than the first drive (probably ID=0) and the controller will recognize the second
drive automatically.

Second, you need a modern harddisk driver which can partition your 1 GB harddisk
correctly. Becasue GEMDOS cannot handle such large partiitons ad 1 GB, you have
divide your 1 GB harddisk in severl smaller partitions. This relies on the
GEMDOS version used and on the driver used.

May be this helps you a bit,

Kind regards,

J.J.

: Hello Everyone,

: I just got NVDI 4 and installed it on my Mega4.
: I've tried it so far with the demo versions of Papyrus (3.62 and 4).

: The printout quality on my Canon BJ-200ex using the default BJ-10e
: driver is excellent. But it takes ages - over four minutes for a page.
: Is this normal? Is there any way to speed it up?

It is possible to use a printer accelerator, such as IPRN, which replaces
TOS and Magics parallel port driver routines.
But I do not know where to get IPRN.

There is no driver and IMHO there won't ever be one because using the parallel port makes no sense if you have SCSI or ACSI.

> : to get the old HD icon and the english icons? If they are
> : available can MagiC4 access external icons?
>
> First: RTFM

I did RTFM BEFORE I posted!! Firstly, there appears to be a typo on
spage 7 - in the first paragraph, last line it says "... selecting Define
Icon from the Options menu." I can't find this selection on the Options
menu - do you mean the Assign Icon selection?

Secondly, I have followed the instructions on page 25 about using the
assign icon selection. From what I understand I am to drag and drop
an icon from the Applikat window and drop it on the current desktop
icon. I have done this and nothing happens. I have tried to exit
the Assign Icon windows every possible way I know how and still nothing
changes. Can you please clarify the process. Thanks.

> There is a folder /gemsys/gemdesk/rsc.
> Any rsc file placed in this folder is scanned for icons.
> Just copy and click.

I have copied the magxdesk.rsc and magxdesl.rsc in this folder
and if I run Assign Icon I get 2 bombs and a dialog box with error
-69. Nothing I have tried results in them ever being scanned successfully.

Can you explain what you mean by "Just copy and click." Click on what?

Thanks for all your help.

Paul

In article <4lh7i1$4rh@madeline.INS.CWRU.Edu>
bdc2@po.CWRU.Edu (Boris D. Cahan) said:-

>
>In cab 1.2b, there is a new cab.app, and a few new text files.
>Haven't figured out what the fixes are, there is no mention
>of it in the docs, and multiline forms still don't work
>
Hmmm......it seems with each new update of CAB it gets harder and harder to find out what exactly is supposed to have changed. Indeed it's much easier to list what hasn't:-(

If Alexander's reading this, would it be possible to outline changes on the website next to the software download link?

I understand that one of the fixes which came with 1.2a was improved colour toning on printout (less yellow hue). As an owner of a mono printer, not worth the download for me:-(

Likewise, I've been unable to find the fixes in 1.2b, which I diligently downloaded for test last night. It appears that none of these are now being beta tested [as a tester, I should know...:-)] before release on the website. If everyone goes over there in ignorance of the update, it only serves so take up valuable bandwidth, slowing down access for those who may benefit from the fixes of the latest version.

If there was a little checklist of known bugs on the website with comments alongside about fixes coming/available this would surely be of help to everyone. Personally I'm awaiting the picture loading fix, the full fix for picture printing, and of course the long forms fix. If tinkering with 1.2a to make 1.2b has further improved colour printouts and nothing else [and I'm in no position to say whether or not this is the case] then I'll leave the bandwidth free for colour printer owners. My turn to clog it up will come later:-) Meanwhile I've downloaded both upgrades with no noticeable improvement on my set-up:-(

Newsgroup: comp.sys.atari.st
Date: 1996-04-23 00:00:00 UTC
From: wvelting@ix.netcom.com
Message-ID: <4lhade$jeo@dfw-ixnews7.ix.netcom.com>
Source record: 146446

I bought one the the US Falcons from the Atari wharehouse sale. These computers were without hard drives. I located a new IBM WDA-280 80meg 2.5" IDE hard drive that was priced right, so I bought it. I have installed it in my computer, and when I go to format it the computer recognizes it as a WDA-280 but then just hangs there for a couple of minutes and comes back with a error message stating that the format has failed and to check all connections and try re-formating. The manual for the Falcon does not state where pin one is on the mother board and of coarse the brains at Atari are more concerned with burrs on the hd bracket than to bother telling you what pin is one. I hooked this up with the thought that pin one was towards the back of the case like the floppy connector, but that didn't seem to be the case. Did I roach my new hard drive?

btw, I have pin one towards the front of the case now.

1654. Please Help? CAD-3D files ----> .DXF files

i{ .PI? Degas pics to put on my Neodesk desktop.

Speed of Light (shareware, currently at rev. 3.8) allow you to save images as .GIFs, .PI? or PC? (Compressed Degas format). I was able to convert .JPGs and .GIFs to .PI3s for use with Superboot 8.1 in the boot up process on an ST.

One problem though, Speed of Light saved the .PI3 in a funny mode which caused the viewer in Superboot to shift the image to the left, about a third of the screen width, and wrap the leftmost part of the image to the right hand side of the screen. I got around this by only using images that occupied the middle third of the screen, so that they would be shifted to the left side when viewed through Superboot.

Regards,

Interesting stuff. What kind of PC hardware would I need to get about the same
speed as on a stock TT then? How much memory would I need to run MagiC-PC?

ppospis@mtroyal.ab.ca wrote:
: I did RTFM BEFORE I posted!! Firstly, there appears to be a typo on
: spage 7 - in the first paragraph, last line it says "... selecting Define
: Icon from the Options menu." I can't find this selection on the Options
: menu - do you mean the Assign Icon selection?

I did not write the manual. When I found this and other ("color" instead
of "colour") errors in the manual, it was too late to correct the
manual.

: Secondly, I have followed the instructions on page 25 about using the
: assign icon selection. From what I understand I am to drag and drop
: an icon from the Applikat window and drop it on the current desktop
: icon. I have done this and nothing happens. I have tried to exit

No. Do the following:
Select exacly one icon, e.g. the printer.
Select "OPtions/assign icon" from the menu bar.
Drag an icon from the window containing all icons to the other
APPLICAT window that contains the scrollbars and the list of all
applications and file types. Drop it exactly on the old icon for
the printer.
Select "OK".

: > There is a folder /gemsys/gemdesk/rsc.
: > Any rsc file placed in this folder is scanned for icons.
: > Just copy and click.

: I have copied the magxdesk.rsc and magxdesl.rsc in this folder

No.
The RSC file must contain icons, nothing more. You can take any
icon file from any other shell (newdesk (TOS), gemini or thing).

Actually I work on a project like that. I expect it to be extreemly fast, since I use the DSP to mix the samples. The work is very much in the beginning, so I can't prommise anything. I expect to be able to play 128 Samples at the same Time. The problem is, how to increase the transport of the samples To the DSP. I hope Caching will do, bit I'm not shure that would be enough.

>
> So when can we get Logc 2.5 for the atari? I'm looking forward to it...

Well, I have a beta version, and it's _really_ nice...

Everything works as it should, although there are still some (one)
fairly serious bug in the memory management that will be fixed in the
final release.

After using 2.5, it's very difficult (impossible?) to go back to version
2.

Get it when it's here - you'll like it!

See ya

>j> available in German... To say "[English users] can't get it" is
>j> misleading at best...
>
>JJ, your own statement is an oxymoron. Look at it: You say Thing 1.x is
>only available in German, and then assail Phil's statement (which is easily
>comprehended) that an English version is not available.
>
> Which is it?

Phil does not say an English version is not available (which btw is
also wrong), Phil says English users can not get Thing Version 1
("Thing V1...english users...they can't get it"), I was pointing out
this is wrong: Thing Version 1 is available to English users _in
German_ _or_ in English to _registered_ English users. (The pro's and
con's of this situation were discussed elsewhere)

Look, I'm sorry if I am not explaining myself well enough , I'm trying
to help Thing here not do it any further damage, but all this was also
explained by Joe Connor (which I included in my reply)

Regards

Cajun

>
>For what reason? I'm all in favour of hearing about anything new!

The reason being that it is quite expensive. I didn't want to keep
mentioning that I wanted one and would be buying one in case it came
across as showing off or boasting.

>D'you have any more info - prices, specs, etc? Perhaps this might be better in
>email?

Here is a quote from a Press Release put out by Titan Designs a
couple of weeks back. I am sure David Encill at TD won't mind me
printing this here, he shouldn't it is an advert after all.

One quick warning. I understand that David Encill is going to
Germany on Friday (26th April) and will return on Thursday (2nd May).
I don't know how this will effect Titan Designs openness during
that time.
David is, hopefully going to bring back some Afterburners so get
your orders in now and you may get it at the end of next week.

~~~~~~
AFTERBURNER
from Titan Designs Ltd

TITAN DESIGNS have recently been appointed as the official UK distributor for
the Afterburner040 Falcon accelerator.

The Afterburner040 can be supplied with either a 68LC040 or full 68RC040
processor. The main difference between the 'LC' and 'RC' versions is that the
higher spec processor comes with an internal 68882 maths co-processor.

PRICES (for the UK, incl. VAT & carriage)

68LC040 - #449.00
68RC040 - #539.00

Afterburner040 gives an enormous increase in sheer processing power and is very
compatible with a wide range of software - existing APEX Media/Intro users can
also upgrade free of charge to v2.2 for an amended version of the when they
purchase an Afterburner040.
~~~~~~

Black Scorpion Software, in conjunction with Titan Designs, will also be evaluating the possibility of running both the NEMESIS accelerator *WITH* the AFTERBURNER to increase the CPU, Bus and DSP speeds even further!

AFTERBURNER TECH SPEC
- Motorola 68040 or 68LC040 CPU producing 32/64MHz
- Two 72-pin SIMM sockets for optional memory expansion up to 128MB Fast-RAM
- Falcon Bus throughport for Expose, Screeneye, FalconSpeed, etc.

Although a larger case will be required, Titan Designs will also be handling the new C-Lab Falcon Mk.X case upgrades which are ideal for use with the Afterburner040. More details on the Mk.X case upgrades when available.

If you have any queries about this e-mail-shot, please do not hesitate to contact David Encill (for Titan Designs or Black Scorpion Software) on 100345.2350@compuserve.com - as you probably know from past experiences, we do respond very quickly!

Tel: +44 (0)121-693 6669
Fax: +44 (0)121-414 1630

6 Witherford Way
Selly Oak
Birmingham B29 4AX
U.K.
~~~~~~

Feel free to Email me if you want to 'talk' to me about it.

I will put together a few simple tests to compare 16MHz 030 and 040 and post the results when I get my AB.

In article <4ljlu8$f3b@ralph.vnet.net>, jtb@lys.vnet.net (TOM BRUBAKER) writes:
#>[...]
#>I've been pretty careful to not run one yet, but I did read that there is a
#>new RAM disk program coming out for MagiC that will support long filenames,
#>and a dynamic ammount of memory. I havent heard if its out yet though..
Yes, that's right. And it's out now, but currently only in German. If I get
any response from Danny Bhabuta one day, there will hopefully be an English
version as well.

I'll upload the file rdxfs_r1.lzh to ftp.uni-kl.de today, it's quite large
because all sources are in the archive.

A short description of its features:
- totally dynamic, only consumes the ammount of memory necessary for the
current contents
- always leaves a configurable ammount of memory free for other applications
- case sensitive long filenames with up to 32 characters
- support of UN*X-filemodes (as far as it's possible with MagiC)
- symbolic links
- highly configurable (drive, label, used RAM-type, etc.)

Ciao

Greetings all!

As I live in New Zealand and there is no Atari support there, I need information of where to get support from. I know of TOAD Computers, but lack any contact to them. I have also just got in touch with a Canadian company called Computer Direct.

Please post contact information of all the support that we have. I'd prefer ways of contacting through Internet, although I can send FAX's.

Thanks

Some of the newer Mac's have PC-exchange, which allows you to just put in a DOS
(or ST) DD disk & copy files .

You can even format a Dos disk on these Macs.

Actually I've got a Falcon. I can agree that earlier versions were
very unstable, but the latest version I use (v2.80a - 18/4/96) is very
stable, in fact, it hasn't crashed a single time yet.

Of course there are some minor drawbacks... there are no english
manual yet (but it's under construction) and some functions doesn't
seem to work (but something makes me think that it's just me).

: I thought it might be AHDI5 but I've installed AHDI6, same result.

My new TT (yes, a Don Thomas Special) does not have that problem. The
difference may be that I have ICD Pro Utilities. I copied that, after
RTFM, to the TT's drive C, and rebooted. ICD recognized SCSI 8 as my
internal drive, with logical drives C,D,E,F, and recognized SCSI 4 as my
Syquist removable, containing the disk I had used with my ST, with
logical drives that used to be C,D,E,F,G as drives G,H,I,J,K. I
installed icons for those, saved the desktop, and all (almost) has been
OK since then.

So far, I have not wiped out logical drive G, which is the ST's boot sector.

Recommendation: Get ICD Pro from TOAD, for about $50. I did, and and
have been pleasantly surprised by what it could do.

My only problem with my new TT is the print screen function. It can
print from a printer icon, or any of my typing programs, and Pagestream
and Calamus, but the "print screen" menu item is grayed out and
nonfunctional. Has anyone seen this problem come and go?

Cab 1.2b did not fix all the bugs in forms handling, apparently.□y
There is an internet service Switchboard, That looks up
phone numbers, anywhere in the country.
HTTP://www.switchboard.com□
It presents several boxes to fill in, and returns
a list of phone numbers, etc matching the criteria.
It works fine with netscape, Mosaic and lynx□ but not with cab.

Source record: 146339

Hi, ATARIANS,
I made a translation of an german acc, which control the deskjets.
It is very good, the only problem is that you have to boot your computer
with the printer "on", or else the computer will take for ever to
recognise the non printer. But except that , the software propose some
fonts , etc. Check it out.
By the way you can get it at http://home.mtholyoke.edu/~kellis

PS: I'm really pissed by German software, I think they're making the best
software for atari, they're very good. But I'm sick of german language,
that's why I propose those translations. If someone disagree whith that,
let's talk about it.
Thank you.

1697. New Web Page! Battlesphere Playtester!

OK Folks. Here is my FIRST Web Page. It's nice. It's got some good information on it. Most notably, I have placed a section detailing what I think of Battlesphere. Since I play test it, I thought there should be one place where everyone can stop by to read about it besides the Battlesphee Homepage.

If you are feeling charitable, drop me a line about it. I am always open to suggestions. And hopefully, it will get better with time. Any questions you have about BS, please email them to me and I will try to address them in my page. I hope to update it every week or two.

Message-ID: <ADA41D85@f103.n3407.z1.fidonet.org>
Source record: 146341

On 04/24/96, Richie quoted All: Re: NVDI 4 - printing speed?.

fV> Try iPTR (I believe that's what it's called). There's a working demo on
fV> Hensa. I considered my BJ200 unusable with Speedo but now it zips.
Frank

When we got our Falcon a couple of years back the first thing bad we
noted
was the lack of speed printing to anything but a dot matrix. The cure was
a
the commercial version of Fprint. If not for that program the Falcon would
have been returned as unusable.

>If someone who can read german could do a quick translation of the
>following for me I might even know whats changed :))

v1.2b (19.04.1996)

* Printer margins weren't calculated correctly if the edit field didn't
contain 3 digits.

* Bug fix: CAB tries to format tables correctly even if a
tag is missing
(this will only work if
is already there). Due to a bug this lead to
an error with nested (?) tables. Should work now.

* Colour printing with NVDI4 should work now.

* Bug fix: If the check box 'Use document setting' wasn't active (which
influences text and background colours) background images wouldn't be
displayed either. Now both settings are independent from each other.

Also, is there anything you should watch for buying one second hand?

Your assistance is much appreciated.

1703. Falcon?

Newsgroup: comp.sys.atari.st
Date: 1996-04-24 00:00:00 UTC
From: john.blackwell@aspects.com
Message-ID: <9604250712093515@aspects.com>
Source record: 146346

Hi guys!

The thing is, apart from its resounding lack of graphic capability my STFM does all the things I need it to, however, I'm poised for an upgrade or something!

I *was* going to upgrade the TOS, though I don't much fancy doing the soldering. I *was* going to get MagiC, but then I discovered that all my main applications wouldn't run under it. I *thought* about joining PC land, but I didn't much like that thought, what with figuring out how to use the thing, not to mention the incredible expense of buying stuff that I already have for the Atari.

So I've had 2 new thoughts. 1, perhaps a graphics card, except for that's beginning to sound expensive again. 2, get a Falcon. Now *there's* an idea. Question is, would it run Cubase, Notator SL and Calamus 1.09n, cos I haven't got the room to keep the ST around for them, and I don't want the expense and time consumingness of buying and learning new programs.

Does anyone have experience of running this little bunch on a Falcon?

Thanks in anticipation!

John

Does this mean that I can play ST games without reconfiguring a translator like Backwards. If I ever get a hold of a cheap Falcon(yeah right!), then I'll get this since I also program on my STe. Just working on getting a PC at the moment, also for programming and games. :)

It would depend on the host adapter in the case more than anything
else, Joe. If it's an ICD AdSCSI, almost any drive will work. If
it's not, well, you're on your own.

> a> Gemini or other blitter-using console windows. If there are any TOS
> a> 1.0-friendly programs to run Gulam/Mupfel in this way, they'd be
> a> ideal.
>
> How about TosWin? I know you can switch the blitter off in this.

Do I have to run MiNT to be able to use this? MiNt looks like my worst nightmare! Otherwise I give it a shot.

Also I tried the CLI.ACC as suggested by Guy H. (found a version called cli2.acc) - doesn't run as a window and like the man says, it's a bit unstable..it's on the right lines, but I think the Mupfel/Venus combination would be better if gave-up on trying to use accessories.

I have to admit, I'm spoiled by the facilities at work and want things to be `just so'...if I make any progress I'll post the results...(I thought about hacking the WTERM.ACC code...if anyone has any experience/comments about this please let me know.)

thanks (to all) for the advice
Andrew.

------------------------------------------------------------------------
SWEDISH ATARI USERS' ASSOCIATION (Svenska Atariklubben)
IN COOPERATION WITH NoCrew PRESENTS

-* THE NORDIC ATARI SHOW AND CONVENTION 1996 *-

WITH CONVENTION, EXHIBITION, SEMINARS,
DEMONSTRATIONS, CONTESTS ... AND MORE!

AT KORTEDALA GYMNASIUM IN GOTHENBURG, SWEDEN
ON THE 14th, 15th and 16th OF JUNE
------------------------------------------------------------------------
NOTE: The information in this text is not complete! Updates will come.

PRESENTATION

NAS was first arranged in 1995. It's a special show with a hacker convent,
exhibition and different seminars - all in one place.

This time the Nordic Atari Show is held in a school building, Kortedala
Gymnasium, in Gothenburg. It offers several small rooms for the hacker
contests and seminars, a big lecture hall for showing demos and films and a
normal size restaurant for the exhibition. Showers and dressing rooms are
available, and there is free carparking in the school area.

Pizza restaurant, cafe and other shops are only a few steps away from the
school. If you want to stay at a hotel please contact us for information
or visit our Webpage for details (http://www.tripnet.se/sak/nas).

Kortedala Gymnasium is fifteen to twenty minutes away from the central part
of Gothenburg. There are good possibilities for communications by tram or
car.

The dates are the 14th, 15th and 16th of June. Gather with your friends and
join us at a very fun and exciting show for Atari users around the northern
and european part of the world!

This year the exhibition and seminars are arranged by the Swedish Atari
Users' Association (Svenska Atariklubben), and the hacker convent by
NoCrew.

Below are all the activities, and the low entrance prices. Last year they
were a little bit high, but this year we hope it's suitable for all
wallets!

THE ACTIVITIES

For more detailed information see below.
```

exhibition
retailers and different associations will be there

hacker convent
competitions for FALCON, STE, ST and 8-bit

demonstrations
Jaguar, Lynx, MiNT, MagiC, Linux, DTP, Internet etc

seminars
about programming, Internet, multitasking etc

others
competitions for the non-programming experienced
(lottery, MidiMaze-contest, harddisk throwing, CocaCola-drinking etc)

THE PRICES

type payment SAK-member non-member

3-day entry prepaid SEK 100 SEK 125
3-day entry at the door SEK 125 SEK 150
1-day entry at the door SEK 50 SEK 75

The T-shirt is gasping yellow with a fine black print. Highest quality.
Don't miss this fantastic offer. Limited quantity.

T-shirt prepaid SEK 75 SEK 90
T-shirt at the door SEK 100 SEK 120

A cafeteria with low prices on CocaCola, Jolt, sandwiches, buns and
other tasty products will of course be available.

If you live in Sweden, you can order your tickets to NAS96 via
our Webpage at http://www.tripnet.se/sak/nas

Otherwise, if you live outside Sweden or don't have WWW access, and want to
order tickets to a lower price, please pay the right amount of money to our
Swedish postal giro account

nr 73 69 10 - 1

before the 31st of May 1996. Don't forget to state your name, address,
country, telephone, fax, email address and SAK membership nr so that we
know who's paying.

THE EXHIBITION

The exhibition will be open on the following times:

Friday 14th 12:00 -- 21:00
Saturday 15th 09:00 -- 21:00
Sunday 16th 09:00 -- 16:00

If you and your company or organisation wants to join the exhibition, then
estimate the space you need and pay the fee to us. We offer you different
sizes (measurements in Swedish meters) depending on your needs.

4,5 m2 costs 500 SEK
9,0 m2 costs 1000 SEK
18,0 m2 costs 2000 SEK

If you want more space, then every extra m2 is 150 SEK. Please contact us first to get further information.

The retailer's fee includes full entrance for two persons.

Nonprofit organisations can join the exhibition for free (with a space of 4,5 m2). This includes full entrance for one person.

Please pay at our Swedish postal giro account,

nr 73 69 10 - 1

before the 31st of May 1996.

State your company/organisation name, address, country, telephone, fax, email address, contact person and space needed. If you'd like to speak at a seminar about something, then tell us about it.

THE DEMONSTRATIONS

More will be added as soon as we get to know about them.

BBS We'll be showing STraight BBS, with products as Semper, LED, Octopus etc. Sysop Bertil Jagard will be answering questions and demonstrate different situations, as well as speaking about ethics and problems with communicating.

MagiC What is MagiC? What is multitasking? Find out by using MagiC 4, and swapping between those programs. Learn about problems and get tips from experienced users.

Making How can magazines be made with Calamus SL? We'll be showing how magazines the Swedish Atari Users' Association (Svenska Atariklubbens) with SL magazine "AtariMagasinet" is made. Tips, problems, features and possibility to make yourself some visit cards or other things to take home.

THE SEMINARS

More will be added as soon as we get to know about them.

Internet What is Internet and how can I use it with my Atari? Experienced administrators will be talking about Internet - history, how it's made, the future and more. We'll put it in reality too, with products for Atari computers that all of us can use - easy!

THE CONVENTION

NOTE: This is preliminary information. Updates will come.

Which computer? Atari in all forms. We want the hackers and the democoders. The Linux freaks. The MiNT people. The Jaguar nuts and everyone else that uses Atari in some form.

Demo contests

BIG ONE
No limit at all. Should be able to run on a Atari compatible computer
present on NAS96.

SMALL ONE
The limit is the shoesize squared (european) of the deliverer in bytes.

World cup in alfabutton

We will try to break the world record in typing a to z on a standard
keyboard. So far, way below two seconds. Go practise...

Films and demos

We will alternate between showing films and old demos on our big
screen projectors. Of course newer ones as well.

Prices

They will most certainly show up and be of good quality.
More info to come.

More information is available from larkov@tripnet.se, or visit NoCrew's
homepage at http://www.dd.chalmers.se/~f93labr/nocrew/index.html

FURTHER INFORMATION ABOUT NAS96

The best way to get new information is to join our NAS96 mailing-list.
Write to nas-users-request@tripnet.se and include the following in the
message text:

subscribe nas-users <your email address>

Our homepage is also informative to visit. It is at
http://www.tripnet.se/sak/nas and is updated whenever it is needed.

If you want more information about NAS96, then use any of the addresses or
telephone numbers below. Email is always the fastest way to get answers.

1710. Re: Desktop Replacement

Newsgroup: comp.sys.atari.st
Date: 1996-04-24 00:00:00 UTC
From: gregor@shelly.goldengate.net
Message-ID: <4177cc$13351f.162@goldengate>
Source record: 146397

I've used neodesk 3 for awhile now (well since I bought my mega and it
came installed on the HD) and haven't had much trouble with it. It seems
to be a pretty powerful environment. The only problem that i have with it
is that certain apps seem to revert back to the TOS desk top when exiting.
I work with macs at work and prefer certain elements of ND to the
7.whatever (the latest) version of the mac OS, particularily the window
x2 function and the splitable scroll function. Maybe I'm lazy, but they
seem easy to use when moving a file (less mouse clicking).

Bill Kimbelton (wlkim@primenet.com) wrote on 18 Apr 1996 21:20:04 -0700:
: I'm thinking of purchasing Neodesk 4 for my Falcon... any input
: regarding Neodesk and other replacement desktops would be appreciated.

My friend is musician and he does not have an access to the Net.
Could someone please post me some details about Cubase like
latest release version, the price and availability.
Thanks for your time,
Tom

1712. Zoo and TwoinOne

Newsgroup: comp.sys.atari.st
Date: 1996-04-24 00:00:00 UTC
From: gregor@shelly.goldengate.net
Message-ID: <4177cc$141113.13d@goldengate>
Source record: 146399
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've recently Dl-ed the two-in-one archiver shell and zoo21.ttp from UMICH
and have a question on the compatibility of the two. I've managed to make
2/1 work with arc.ttp, lzh.ttp, and ST zip. I have had problems with
using the shell with zoo.ttp, though. Last evening I tried to unzoo a
file that consisted of two parts in the archive, a read me and a
directory of avr sounds. 2/1 would decompress the read me and list the
directory but not decompress the avrs. When I selected the directory (or
an individual avr), and after a period of HD churning, I kept getting an
error of "no files matched". The same file readily decompressed from
zoo.ttp's command line with out the shell.
Am I missing something in the option menu? Are the AVR's in the folder
not compressed and simply need to be moved?
The shell itself seems to be pretty handy and am looking forward to
testing it out on tar, uu, and lrj. any insights?

: Hello Atarians : Is there any software capable of playing midi files
: (falcon) without using any external synthesizer?
: (The sound chip build in is
: already a synthesizer!).

There was a program being work upon by Griff of the MPG player and MOD player fame (and others but Im not sure of what so please accept my apology now). It was to be a MIDI player using samples like the DOS boxes. I don't know whats become of it at this time though. It's been a while since I had heard any news but if he does finish it, I'm sure it will be as excellent as his other works.

The only other program was the MIDI MUSIC MAKER which played and converted more than just standard MIDI files using the ST sound chip. Very limited but it worked....

Andrew Wright (aw@dial.pipex.com) wrote:
: There are basically two choices for emulating an Atari ST on a PC, the
: Gemulator and the Janus card. Both require a free 16-bit ISA slot in the
: PC, both are driven by software. Gemulator 4 is cheapest and runs under
: Windows 95. Janus is very expensive I believe and not quite as flexible
: IMHO as standard resolutions aren't supported.

There will be a third solution with the next 2 to three months, which
does not require any hardware. It is the PC version of Magic, the TOS
replacement. On a Pentium expect TT speed and - in contrsast to all other
existing emulators- the latest operating system technology available on
Atari, including preemptive multitasking, iconify, long file names (itc
seems that you can use WIN95 file names directly) etc etc.
IMHO the best choice

Another possibility would be to use STonX, a freeware emulator that runs
on all systems that have X-Windows.

Alfred

1717. Re: HD help

Newsgroup: comp.sys.atari.st

Message-ID: <4lkj2a$162@preeda.internex.net.au>
Source record: 146404

I don't see any problem with formatting etc, just use ICD Pro or similar BUT
If the scsi to dma adaptor is an old one, it won't 'see' the new SCSI 2
drive.

Perhaps sell the old 105 as a complete going unit and purchase The Link 2.
It comes with cable and ICD Pro software.
It will handle all this and more, like CD-ROMS etc.....

Good luck.........Julian.

>problems, it may be out of Alexander Clauss' hands..

Well, I'm not too hot on forms, and I haven't got Stik (although use cab to
preview my pages) but I would guess that it is the lack of email facilities.
The only way that I know (and there *is* a better way) of doing forms is
to have the <FORM METHOD=POST ACTION="mailto:email-address"></FORM> tags.
Now, as we all know, CAB/Stik doesn't support the mailto: tag so it is
unlikely to handle this method of forms.

As soon as CAB has a way of comunicating with mail-servers, I would guess
the problem will be fixed...

: was looking at the specs of the PAK and was *very* impressed, and suggested
: get one. "OK, if you pay..."!

Funny! Suggestions so far.....
MagiC (thanks to Guy Harrison)
Graphics Card (Pak/3?), 17" Mag, Fast Ram (thanks to Jo Even Skarstein)

Where on the web can I get more infomation on MagiC and Pak/3? You see,
my wife has said no to the new computer (so, forget Gemulator). She
might buy the idea of an upgrade. Although, she was talking to me about
an $800 camcorder this morning (you gotta love it!).

I have two ST's (1 meg and 2 1/2 meg) and one MegaSTE (4 meg, 120 HD).
They are all set up and still get used some (some old classic games).
I wish that I could cobble them all together into one system.

I would like to cruise the web in vivid color. That would sell anyone on
upgrading. Isn't there a hardware fix to the Mega's baud rate bottleneck?
Isn't this a great hobby.

1732. ATARI ST FTP SITE LIST

Newsgroup: comp.sys.atari.st
Date: 1996-04-25 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <317fa5063dadf522@sn.no>
Source record: 146269

Time for another update to the Atari ST FTP site list.
As usual I'm open for any suggestions/comments/information regarding the list.
Remember: I rely on you; the public to help me keep it up to date and correct.

Hallvard (hallvart@sn.no)

Changes since last list:

ftp.uni-frankfurt.de : marked off as a specialized/small site
ftp.uni-trier.de : NEW site
ftp.regent.e-technik.tu-muenchen.de : re-inserted in the list

---------- FILE START ----------
Distribution date: 25-April-1996
Distributed to : comp.sys.atari.st & comp.sys.atari.st.tech
File location : ftp://ftp.sn.no/user/hallvart/atari/info/ftplist.txt

Re-distribution allowed as long as nothing is altered or omitted.
Copyright (c) 1994-1996 Hallvard Tangeraas (hallvart@sn.no)

MIRROR SITES

FTP mirrors are alternative sites to certain popular ones which are
usually under a high load most of the time (many people accessing them
at the same time).
Mirror sites contain the exact same directories and files, but have
different entry points. Try to use the one closest to you geographically
and not during business hours (in that geographic area).

Mirrors to 'atari.archive.umich.edu'

MAIL SERVERS

Mail servers can be used to get hold of the same software as through FTP,
but instead of using a lot of download time online, files can be 'ordered'
via email.
In order to get information about how to do this, send an email to the
various addresses below with the word: help
in the mail itself. If possible, do not include any 'signature' in the mail,
as the automated system which replies to these mails tries to interpret any
message (and with a certain amount of errors no response to your requests
will be given at all).

What to type What it does
---
ftp [ENTER FTP MODE]
open FTPsite-address (i.e: open ftp.funet.fi) [OPEN THE FTP SITE]
anonymous (when asked for username) [INSERT USERNAME]
USERNAME@SITE (your email address- i.e. hallvart@sn.no) [INSERT PASSWORD]

Example:
---
oslonett.no% ftp [ENTER FTP MODE]
ftp> open ftp.cs.tu-berlin.de [OPEN THE FTP SITE]
Connected to caramba.cs.tu-berlin.de.
220 caramba FTP server (wu-2.4/fb13[34] 18-Feb-1995) ready.
Name (ftp.cs.tu-berlin.de:celine): anonymous [INSERT USERNAME]
331 Guest login ok, send your complete e-mail address as password.
Password: celine@geonet.com [INSERT PASSWORD- (NOT SHOWN)]
230-You have reached Berlin, Germany. Access is allowed all day.
---

* You can also enter a site and start ftp at the same time:

ftp FTPsite-address (i.e: ftp ftp.cs.tu-berlin.de) [START FTP/OPEN SITE]

Example:
---
oslonett.no% ftp ftp.cs.tu-berlin.de [START FTP/OPEN SITE]
Connected to caramba.cs.tu-berlin.de.
---

* It's also possible to use the IP number instead of the usual FTP
site address:

ftp IP.number (i.e: ftp 130.149.144.4) [START FTP/OPEN SITE WITH IP NO.]

Example:
---
oslonett.no% ftp 130.149.144.4 [START FTP/OPEN SITE WITH IP NO.]
Connected to 130.149.144.4.
220 caramba FTP server (wu-2.4/fb13[34] 18-Feb-1995) ready.

_____

[2] Preparing for file downloads
==========

cd /directory/ (i.e: cd/pub/atari/) [MOVE TO DESIRED DIRECTORY]
bin [SET TRANSFER MODE TO BINARY]
ls -l (or: dir) [SHOWS A DIRECTORY LISTING WITH FILE-LENGTHS]

** Some FTP sites don't accept 'ls -l' for some reason. In those rare cases
use 'ls' instead (or use 'dir').

Example:

```
ftp> cd Music/ [MOVE TO DESIRED DIRECTORY]
ftp> bin [SET TRANSFER MODE TO BINARY]
200 Type set to I.
ftp> ls -l [SHOWS A DIRECTORY LISTING WITH FILE-LENGTHS]
150 Opening BINARY mode data connection for /bin/ls.
total 4624
-rw-rw-r-- 1 ftpadm atarimod 3409 Feb 19 12:48 00INDEX
-rw-rw-r-- 1 ftpadm atarimod 37419 Mar 18 1993 50play12.lzh
-rw-rw-r-- 1 hesche atarimod 105936 Jul 24 1995 525_v211.lzh
-rw-rw-r-- 1 ftpadm atarimod 168363 Mar 10 1993 accomp25.lzh
---------------------------------------

* If you want to go back one directory:

cd .. [GO BACK ONE DIRECTORY]
cd /. [GO DIRECTLY BACK TO ROOT DIRECTORY]

\_\_\_
```

Example:
---
ftp> mget ma* [GET ALL FILES STARTING WITH 'ma' IN CURRENT DIRECTORY]
mget maccell33.zip? y [DO YOU WANT THIS FILE (y/n)?]
150 Opening BINARY mode data connection for maccel33.zip (9012 bytes).
####################
226 Transfer complete.
mget mauswind.zip? y [DO YOU WANT THIS FILE (y/n)?]
150 Opening BINARY mode data connection for mauswind.zip (49373 bytes).
##
##############################
226 Transfer complete.
mget maxidisk.zip.zip? y [DO YOU WANT THIS FILE (y/n)?]
150 Opening BINARY mode data connection for maxidisk.zip (20970 bytes).
##
226 Transfer complete.
ftp>
---

* you can also use a 'wildcard' to get hold of single files or a specified
selection. Just be sure the wildcard is unique.

i.e. if you want to download 'stzip26.lha' and there are no other files which
start with the letters 'stz', you can type: mget stz*.

You can also download all files within a directory with a single
command: mget *

PS. you have to use 'mget' with wildcards- 'get' won't work!

Hint: if you're using 'mget' a lot and don't want to be asked if you want this
file or not, you can use the command 'prompt'. FTP will then proceed to get all
the files that match your wildcard without asking if you want them.

Example:
---
ftp> prompt [TURN OF 'GET THIS FILE (y/n)?']
Interactive mode off.
ftp>

___

quit [EXIT CURRENT FTP SITE/FTP MODE, RETURN TO UNIX]

Example:
```
--------------------------------------
ftp> quit [EXIT CURRENT FTP SITE/FTP MODE, RETURN TO UNIX]
oslonett.no% [BACK IN UNIX]
--------------------------------------
```

* When doing a 'close' and re-entering a new FTP site you won't have to set up features like 'bin', 'prompt' and 'hash' again.
You will however have to set it up again if you choose to 'quit', then restart FTP.

>>>

A SHORT SUMMARY OF FTP COMMANDS/PROCEDURE
==========

ftp
open {FTP site address} [OPEN FTP SITE]
Username: anonymous
Password: {your email address}

cd {directory/directory etc.} [GO TO DIRECTORY]
bin [SET TO BINARY TRANSFER MODE]
hash [DISPLAY '#####' CHARACTERS FOR VISUAL CONFIRMATION OF DOWNLOAD]
ls -l (or dir) [FILE/DIRECTORY LISTING WITH LENGTHS]
get {filename} [GET A SINGLE FILE]
mget {filename filename filename filename} [GET SEVERAL FILES]
quit [EXIT FTP SITE/EXIT FTP MODE]

Other useful commands to know
==========

stat (or status) [DISPLAYS USEFUL INFORMATION ABOUT SETUP]
prompt [TURNS ON/OFF 'GET THIS FILE (y/n)?']
get {filename} - (i.e: get 00index -) [DISPLAYS TEXT FILE ONLINE]
!host {FTP site} (i.e: !host ftp.sn.no) [SHOWS IP ADDRESS OF SITE]
help [DISPLAYS A LIST OVER FTP COMMANDS]
help {command} (i.e: help bin) [EXPLAINS COMMAND]

FTP commands

! escape to the shell
$ execute macro
account send account command to remote server
append append to a file
ascii set ascii transfer type
bell beep when command completed
binary set binary transfer type
bye terminate ftp session and exit
case toggle mget upper/lower case id mapping
cd change remote working directory
cdup change remote working directory to parent directory
chmod change file permissions of remote file

```
close terminate ftp session
cr toggle carriage return stripping on ascii gets
delete delete remote file
debug toggle/set debugging mode
dir list contents of remote directory
disconnect terminate ftp session
form set file transfer format
get receive file
glob toggle metacharacter expansion of local file names
hash toggle printing '#' for each buffer transferred
help print local help information
idle get (set) idle timer on remote side
image set binary transfer type
lcd change local working directory
ls list contents of remote directory
macdef define a macro
mdelete delete multiple files
mdir list contents of multiple remote directories
mget get multiple files
mkdir make directory on the remote machine
mls list contents of multiple remote directories
mode set file transfer mode
modtime show last modification time of remote file
mput send multiple files
newer get file if remote file is newer than local file
nmap set templates for default file name mapping
nlist nlist contents of remote directory
ntrans set translation table for default file name mapping
open connect to remote tftp
prompt force interactive prompting on multiple commands
proxy issue command on alternate connection
sendport toggle use of PORT cmd for each data connection
put send one file
pwd print working directory on remote machine
quit terminate ftp session and exit
quote send arbitrary ftp command
recv receive file
reget get file restarting at end of local file
rstatus show status of remote machine
rhelp get help from remote server
rename rename file
reset clear queued command replies
restart restart file transfer at bytecount
rmdir remove directory on the remote machine
runique toggle store unique for local files
send send one file
site send site specific command to remote server
Try "rhelp site" or "site help" for more information
size show size of remote file
status show current status
```

```
struct set file transfer structure
system show remote system type
sunique toggle store unique on remote machine
tenex set tenex file transfer type
trace toggle packet tracing
type set file transfer type
user send new user information
umask get (set) umask on remote side
verbose toggle verbose mode
? print local help information

** Most of these commands work as 'on/off switches'. Each time you enter the
command it switches over to the opposite position (from on to off or
vice versa). If you're not sure about it's position, type: stat
(or: status) which will show your setup.

Be sure to check if transfer mode is set to 'bin'!!!! (if you try to
download binary files in ASCII mode all your downloads will be useless!-
You can download text files as binary as well, though you sometimes might
have to convert the end-of-line characters afterwards-
(get hold of 'unix2st.ttp' or similar program for this).

Wow, that's some dedication to a fellow user, thanks! :')

> Effectively I found the same problems as you said for Atari works.
>Reponse: get NVDI, It is the best thing you can do for your computer, I
>admit , it a little bit expensive, ($89) but you'll be very happy.

For those of you experiencing a problem, I have found a "half-assed" fix. . .
I found that documents I had written under TOS 4.04 (before switching to
Geneva) displayed fine, and allowed me to switch fonts. If you want a
"quick fix" to your problem with AW, without buying NVDI (I think I will,
though), try this:

Under normal TOS, write a document that contains text, formatted with
each individual font). It should look something like this:
-
Swiss Bold (in Swiss bold)
-
Dutch 801 Bold Italic (in D 801 BI)
-
etc.

Save it as a word processing document.

Reboot the computer using Geneva.

Load AtariWorks, and load your new document up.

Now open the font box. Wow! It works!

Now open your new WP, Spreadsheet, or database and font away!

You'll get an occasional slowdown, but I have yet to get a crash.

As for Papyrus & Geneva, Speedo 4.1 isn't the problem. Apparently, the
version of Papyrus I have doesn't get along with Geneva. I'll be calling
Oregon Research shortly to see if a patch is available. I don't want to
have to buy a whole new word processor just to run under Geneva. I'll
let you know if anything develops.

1734. WTB: MegaSTE (US)

Newsgroup: comp.sys.atari.st
Date: 1996-04-25 00:00:00 UTC
From: dano@falcon.ic.net
Message-ID: <4lo85l$3r@condor.ic.net>
Source record: 146271

Well, from what I've seen, in order to purchase an ST that would allow me to move easily to a TT or Falcon later, the MegaSTE is recommended. I figure if I buy a graphics card or something for the VME slot, I can make sure I get one that is TT compatible and use it later if I upgrade.

Anyway, I'm looking for a reasonably priced and clean MegaSTE in the United States. It doesn't need a hard drive, but I'd like to have a host adaptor (The MegaSTE doesn't have SCSI built in, right?) 1.44Mb floppy is preferred.

Also, I already have a monitor -- a SC1224. Is this suitable to get started with? I suspect I'll need a monochrome soon too, but this isn't necessary right now.

Since I'm not an Atari user, any extras like programs, utilities, manuals, etc. would be very helpful.

-Dan

Source record: 146274

Suggest that you use the bin command before FTPing lzh files in
the future! Or alternatively use CAB to access
http://www.umich.edu/~archive/atari/ and setup lharc 3.10 as an external
viewer for lzh files! I just used CAB to get that file and there isn't
anything wrong with it!

On 25 Apr 1996, Mark J. Anthony wrote:

1739. Virus on ftp.cnam.fr (in archive carpdiem.zip)

Newsgroup: comp.sys.atari.st
Date: 1996-04-25 00:00:00 UTC
From: fp5@alpha2.bton.ac.uk
Message-ID: <DqFLt5.Kr3@bton.ac.uk>
Source record: 146276

```
The game contained in the archive /Atari/Falcon/Games/carpdiem.zip
on the Cnam ftp server (ftp.cnam.fr) has been infected by a virus,
do not try to execute the program if you do not want to be annoyed.

If you've already tried it, then you are probably infected.
If you do not have any virus killer (like me for example), and
to destroy the virus, you'll need to delete the file c:\auto\~.prg
(created by the virus) and then do a cold-boot (or shut down the
computer for a while) ...

Thank you for your reading

Gaston.

Hi, I have a falcon and a SVGA 14" Acer 34T.
If I add a graphic card like screen blaster or blow up, what are the good
things about it.
I mean, can I get something like 800*600*true colors?
The monitor is supposed to display more than that.
Or is the screen is faster in the usual resolution?
Or do I get more memory available when I work under 640*480*256?
Please , answer me I don't understand...
Nobody is really clear about that..
Thank you..

Bye..

Here are some figures post by Frank_Szymanski@do2.maus.ruhr.de a few
weeks ago.
I assume that NOVA 2Mb is a graphics card so the graphics performance
is probably higher than a normal Falcon. The reference used is an
ST so the speed increase of the Falcon won't be quite the figures
given.

I would be very surprised if Linux/68k doesn't work. The Afterburner
is, apparently, very software compatible. The 040 is entirely
compatible with the 030.

According to the last System Solutions catalogue I got (Spring 95)
the PAK 68/3 is designed with the MegaST in mind. STe and MSTe will
need an adaptor/buffer board.

Rich.

I've personally used Quantum 240LPS's and Seagte ST1480N's with no
problems, but any SCSI drive that allows parity to be disabled should work.

There isn't one, really. I use a $ meg Mega STE, with TOS 2.05. I use Oasis for
mail and news, CAB/STik for WWW, ftp and Antmail. Using HSmodem6 and modem 2
gives me 115200 baud. I've recently improved things further by using Magic4
which gets rid of Tos2.05 corruption problems. I don't see any bottleneck!!
Futher, the Matrix card I use gives me quite respectable graphics.

I reciently got one of the Atari TT's from Don Thomas internet offer. it's working great, but I have some questions that some other TT owners I'm sure could help me out with.

I'm use to the way SCSI devices hook up to the ST, but is it easy to find cables to be able to run my same HD I've used on my Mega ST (external unit with centronics connectors) to the TT?

Also, I reciently purchased a used 44 meg Syquest drive which has 25 pin connectors on it. Can I get a straight 25 pin to 25 pin cable (I.E. like a modem cable extention cable) and use that too hook it up to the TT's SCSI port?

And my TT is suppost to have 2 megs of ST ram and 4 megs of TT ram, is there any way to verify this and what's the best way to set program to use the faster TT ram? I have Maxifile from Codehead that has a flag setter which say's USE TT RAM, it that all I need? Is there other prgs to use for this? Is there a list of prgs which are not compabible with TT ram somewhere?

Thanks Mike Harvey

>this is wrong: Thing Version 1 is available to English users _in
>German_ _or_ in English to _registered_ English users. (The pro's and
>con's of this situation were discussed elsewhere)

What it boils down to, then, is that English-users either forget about
Thing V1, or buy a pig in a poke. That's just possibly worse than no
availability at all. I remember my experiences with DC Data Diet.
There was $50 I could have spent on anything else - including
explosives to blow up my hard drive - and been much better served; but
I bought it without seeing it run first. Never again!

>Look, I'm sorry if I am not explaining myself well enough , I'm trying
>to help Thing here not do it any further damage, but all this was also
>explained by Joe Connor (which I included in my reply)

Making an English demo version of Thing V1 unavailable is all the
damage necessary. I doubt that there is much you COULD do to make
things worse in a "buyer beware" world.

>__jim n.
Your Mac will also use DD disks. Put in an IBM formatted DD disk and your Mac
should recognize it and write to it under the rubric "PC Exchange" or
somesuch. Then this disk can be used in your Atari. The only difficulty I can
see would be if the compressed files were too large to fit onto a DD disk. In
that case you might want to try bin hexing tham and chopping them up into
720KB pieces and then pasting them together on the Atari. Yukk.
Good luck.bonne chance

Ermmmm. AFAIK its ACSI not SCSI... so even then not comaptible !!!

>
>So my questions are things like:
>
>1. Could I use PC SIMMS in an ST?
Not straight off unless they have the right number of Pins and are
SIMMS, otherwise you'll need an adaptor, and I'm not sure one exists.

>2. Could I use an IDE drive in an ST?
again I don't thinks so, the Falcon yes, ST no... get a SCSI drive
instead.

>3. Is there anyway to get a better TOS? (I can blow my own ROMS if need be.)
yes buy a switchable 2.06 upgrade.... then you can switch to your old
TOS if you like.... they are about 50UKP

>4. Where do I get those funny monitor plugs so I can hook up a VGA monitor to
> the beast.
I think for an ST you just use a modified VGA, don't know much about
these except they work as Mono Monitors... I've seen some sold already
converted.

>5. What are Atari doing now anyway?
Produceing games for their Jaguar Games console, and software for
other platforms I think.

Sounds like your best bet is to go to someone like Toad in the US, or
System Solutions in Europe and say, I've got this ST, I want to add a
monitor Harddrive and some more RAM, how much will it cost... then you
get stuff that will work with your ST, and not a great deal of hassle.

You could try producing your own stuff, but to modify harddrives and
RAM Chips is probably too tricky !

JL> Or even a 500 or so megger... will it work as long as it's a
JL> SCSI? And what if it's a SCSI-2, will that work?

Hi Joe,
Quantum's new drives cause much trouble for Atari users, since they use
something called bus-arbitration. I'm not sure you can use an arbitrating drive
with other than Falcon or TT, but maybe someone else knows?
However, even if you can use it, you'll have to use a hard disk driver that
supports bus-arbitration (HDDriver or SCSI-tools), but you'll have to use your
old drive as boot drive - you can't boot from the new Quantum drive.
I'd prefer a Conner HD instead, and if your host adapter isn't a Link-II,
you'll have to use a HD where you can disable the parity bit - they're becoming
harder to find every day...
A 1GB HD is no problem to use, but you'll have to partition it into several
partitions.

Best regards,

Claes

Hi Thomas!

TF>Is there now a PC version of magic???

Yes. But let's write 'MagiC'. Magic is something else.

TF>I know Magic is for the MAC line.

No.

MagiC is for ATARI-Computers.
MagiC-Mac is for Apple-Computers.
MagiC-PC is for...you know what. :-)

TF>When did a PC version come available.

ASH is still working on it. It is not yet released, but one couldt see a demo at an exhibition in Berlin last weekend. It's *not* the Gemulator.

MagiC-PC needs W95 or NT and runs as a task. At this time, on a 100MHz-pentium it's as fast as a TT, but, as i mentioned above, they're working on it. It's more compatible to TOS than MagiC-Mac, i.e. many old games which don't run with magiC-Mac will do it with MagiC-PC.

The programmer for the WIN-part is Franz Schmerbeck-Mister Signum!

bye

Michael

The next SwapMeet is Monday, May 6th, 1996.

ACE of America, an All Computers and Electronics User Group, with a special emphasis on Atari. At ACE Swap Meets you might find Atari, Apple, Macintosh, Commodore, Amiga, IBM & Clones, Nintendo, SNES, Sega Genesis, Jaguar, Game Boy, Game Gear and Lynx. You could also find the following items to go with your system, such as Printers, MoDeMs, Monitors, Hard Drives, Disk Drives, Power Supplies, MIDI Devices, Mice, Joysticks, CD Roms, Cables, supplies and Accessories.

ALL COMPUTERS, GAME MACHINES AND ELECTRONICS ARE WELCOME!!

ACE Is currently holding Monthly Swap Meets on the First Monday of each Month from 7 PM, except on certain Holidays that we must reschedule due to our facility being closed. Swap Meets are Held at 1819 NW Everett at the NW Service Center 3 Blocks North of the corner of 18th and W Burnside in Portland, Oregon. USA! Table space is $10. Tables provided as long as they last. Show up early to get a good table, like 6:30 PM.

FREE ADMISSIONFREE ADMISSION**FREE ADMISSION**FREE ADMISSION**

On the May 6th SwapMeet, we will be Raffling off a Panasonic Printer! Anyone showing up can win. Just be their for the Drawing. The first Ticket is ***FREE***! Additional Tickets are a Dollar each. This is One of Many good reasons to come to Our SwapMeets.

PLENTY OF FREE PARKINGEVERYONE WELCOME**PLENTY OF FREE PARKING**

FOR INFO CALL OUR SWAPMEET HOTLINE WITH 24 HOUR RECORDED INFO, CALL: (503)650-7196 OR FOR FURTHER INFO FROM BEN, INCLUDING TABLES: CALL FROM 3 PM - MIDNIGHT / MON-THU, FRI 3 PM - 6 PM: CALL BEN AT (503)256-9974!! IF BEN IS AWAY FROM THE PHONE, PLEASE LEAVE YOUR HOME NUMBER AND HE'LL TRY TO RETURN YOUR MESSAGE! THESE SWAP MEET SPONSORED BY ACE OF AMERICA!!

This Message is distributed throughout the Pacific NorthWest, everyone reading and their Brother is welcome to come and Attend!!

Please Direct all Replies to bensmith@teleport.com in E-Mail or call (503)650-7196 anytime.

The next SwapMeet is Monday, May 6th, 1996.

u>
u> This is not a PC bug, but a bug in Protobt() and the Desktop of TOS
u> before 1.04! $F7 is not a valid "media byte". -> ISO 9293

What's the date of the ISO 9293 standard, Rainier? I suggest it post-dates TOS. Thus, the "missing" byte in a TOS-formatted disk is not a bug - it's a consequence of the ISO bowing to pressure from MicroSoft. Point: My old 520ST (TOS 1.0) can format, read and write disks up to 82 tracks, 11 sectors per track. It doesn't need a "media byte" to determine the size of the disk, nor does it insist that a disk without the "media byte" is unformatted.

MS-DOS is BADLY written, that's all. The fact that the ISO decided to go along with Bill Gates and suggest that all disk access should be denied if the disk wasn't formatted with one single byte in the boot sector is simply stupid. After all, a floppy disk and disk drive together are a mechanical assembly, prone to misalignment and wear. Any fool can tell you that mechanical things wear out. If the entire disk is perfectly good, but that oen spot in the boot sector is damaged, MS-DOS tells you your disk is now trash. TOS will be able to recover all the data and copy it to a new disk.

So, if the ISO says that byte is _required_, I'm sorry to inform you that the ISO is short-sighted and just a bit ignorant.

KLE>Hi, I have a falcon and a SVGA 14" Acer 34T.
KLE>If I add a graphic card like screen blaster or blow up, what are the

Sorry, but screenblaster and blow up aren't graphics cards. They are only screen enhancers.

KLE>I mean, can I get something like 800*600*true colors?

Nope. For this you need a real graphics card, like the NOVA. And it must have 2 megs of ram. If you can afford buy it.

KLE>Or do I get more memory available when I work under 640*480*256?

Yes you have more memory in lower resolutions because of TOS' half-screen-buffer which means 479232 bytes more when you use 640x480x256 instead of 1024x768x256

1775. CAB 1.2b problems...

Newsgroup: comp.sys.atari.st
Date: 1996-04-26 00:00:00 UTC
From: magnus.thylander@stacken.ct.se
Message-ID: <ftn_2.204.219.0_14728b32_Magnus.Thylander@stacken.ct.se>
Source record: 146112

Hi!

I'm having a few problems trying to get CAB to work...

First: No matter what CAB-version I use i get the message "read error in file .
.\CACHE\0001" sometimes when I click on links that are supposed to take me to
ftp-archives or similar...

Second: I tried upgrading from v1.1a(included in WWW130.LZH) to 1.2b but now I
cannot connect to any Internet-site... No matter what URL I try to connect to
I get the "Read error...." error message... Local files work okay... I've
tried clearing the cache but no good...?

A completely different question: Does anybody know whether it's possible to
use >540Mb EIDE harddrives using the Falcon's internal controller?

Greetings,
Thylboy@stacken.ct.se

Reply by email please!!!

1776. Re: Why a graphic card?

The advantage with an accelarator is that the falcon can manage higher resolutions
(if the acc speeds up the bus).
I run 36 MHz (18 MHz on bus) and the Blow-up (hard-II) can manage:

800 x 608 16 colors 78 Hz
768 x 608 256 colors 67 Hz
600 x 400 True color 63 Hz
In the other res I don't have maximum:
768 x 608 2 colors 77 Hz
768 x 608 4 colors 77 Hz

The limit in the true-color mode is that the bus can't manage to send data
that fast on the bus (must acc it more).

> Does anyone have experience of running this little bunch on a Falcon?

Cubase (at least the later versions) will run okay. I don't use it myself, but I know V3 works, and there's always Cubase Audio, if you really want to get fancy. Calamus 1.09n runs in monochrome, although it's not restricted to any particular res - which is great with a BlowUP or Screenblaster (I've had it going at 1024 x 768 - ideal for getting a feel for the layout of something).

NSL will not work, unfortunately. There was talk of a patch that C-LAB were writing to include with their Falcons, but I never heard anything of it. Backward 3 (maybe 2?) came with a similar patcher, but I never got it to work. The best advice here is to upgrade to Logic, which is a superb piece of software, and you get three extra MIDI outputs bundled free with the dongle. V2.5 (the last version for the Atari, but more than most people will ever need) should be out soonish.

The only question then is over how you plan to switch the cubase and Logic dongles. You are using an official cubase, aren't you......?

Cheers,

Xav

#define WM_ICONIFY 26
#define WM_UNICONIFY 27

These values are the values for iconifying and uniconifying a window.
The rest of the parameters passed are the size of the window to make when
iconifying or uniconifying.

eg.: wind_set (wind_handle,WM_UNICONIFY,x,y,w,h)

x,y,w,h = dimensions of the uniconified window.

Hope this helps.

1780. CAF questions

Newsgroup: comp.sys.atari.st
Date: 1996-04-26 00:00:00 UTC
From: bili6745@mach1.wlu.ca
Message-ID: <DqGIFt.C70@info.uucp>
Source record: 146159

I just started to use CAF and have found one problem so far that I have not been able to solve with the manual:

My samples come through VERY quiet from the mic. The audio image is a single pixel line for the most part. I know that double clicking on the tarck allows you to edit it and that here you can control the volume BUT it seems that this is only playback volume and does not affect the sample. What i'm looking is for a method of amplifying the sample after I record it or a way to record at a MUCH higher volume.

1781. Install ahdi on a TT hd with large partitions?

Newsgroup: comp.sys.atari.st
Date: 1996-04-26 00:00:00 UTC
From: wknaka@saul2.u.washington.edu
Message-ID: <4lq0aa$8tf@nntp5.u.washington.edu>
Source record: 146160

I want to be able to boot off the internal harddrive on my TT, which I've replaced with an 850MB one. I have 4 partitions. Three of them are small enough for ahdi to handle, one is too big. But the one that's too big isn't a problem, since it will have linux on it, and won't be usable from TOS anyway.

So what I want to do is install something in the boot sector that will automatically run a program, which would be a hard disk driver. I guess I'd rename ahdi.prg to whatever name it needs to be (probably something.sys). Essentially, I want the exact setup that hinstall/ahdi would give, if hinstall would run. Using ahdi would be fine, as it handles the partitions I'm planning to use with TOS.

hinstall gives the (wrong) error message "not enough system memory" if any of the partitions are too large (it works fine if the partitions are small enough), and then won't install shdriver.sys.

I've gotten cbhd to work as a kind of hinstall substitute by running "install" from the cbhd config program and then copying ahdi.prg to cbhd.sys. But I can't read the German docs and don't know what I'm doing (I don't know the difference between the various programs that come in the cbhd package and just decided to keep it simple and use ahdi). Incidentally, after experiments like this, how do I "clean up" the boot sector? cbhd's config program appears to have an uninstall selection (at least I think it does), but it's never selectable.

Advice? What other programs can I use? Can I get hinstall to work? Can anyone explain how to use cbhd? I can't see the need for a commercial hd driver, since ahdi is perfectly adequate for the TOS partitions I'll be using, and linux has its own drivers anyway. I know I could boot off a floppy with ahdi in the auto folder, but I'd rather not. BTW, hdx 5.04 formatted and partitioned the drive perfectly If only hinstad run...

Thanks in advance,
wes

BTW, maybe I'm doing something completely wrong. When I had 4 small partitions, I ran hinstall 5.00, then deleted shdriver.sys and in its place put a copy of ahdi.prg 6.061 renamed to shdriver.sys. It worked, so I assumed something was written to the hard drive that, when booted, it looked for and ran shdriver.sys.

1783. For Sale (UK): 1040STF expanded to 4MB RAM

Newsgroup: comp.sys.atari.st
Date: 1996-04-26 00:00:00 UTC
From: djs@jet.uk
Message-ID: <djs.830507578@gen-off-3>

Title says it all really. Except the price. Which is 130 quid
inc UK delivery. I may be able to knock off a fiver if you can collect
from Reading or Abingdon.

Could be a cheap way of upgrading RAM, buy this and sell off your old m/c?

>let's talk about it.

I can understand that. That is why I translate german and french
programs, both shareware and commercial (the commercial stuff I do with
the permission of the author and/or distributor). (Speaking of which, if
no| software is reading this, I'd really rather translate your disk based
version of your manual instead of having to do it from Arabesque 2's
paper manual) If anyone has any software that they really want
translated, I like doing that sort of thing. Oh, and the new manual for
OUTSIDE 3.30 really kicks butt, IMHO! (grin) I'm currently working on
translating EnhancedGEM's documentation with my friend Blaine, so any
programmers who would like to be able to read the documentation, it is
coming. (Does anyone have EGEM 2.25? Apparently, a version of Freedom
(a very cool file selector) used that version, but I can't find it. Can
anyone point me to it?) I'm not going to go into what I've translated
(other than the stuff I've just done), but has anyone got any
translations that they're doing right now?

: Or do I get more memory available when I work under 640*480*256?
: Please , answer me I don't understand...
: Nobody is really clear about that..
: Thank you..

Hello fellow translator person! I am unsure about the BlowUp
(although, when I get my FX card installed, I should know more as it
comes with one), but the way I was led to believe, if your system has
enough memory, and you can determine the right vertical and horizontal
frequency for your monitor to achieve 800x600xTC, it is possible
(personally, I'd recommend the Nova card for the Falcon which allows you
to have 1024x960xTC, and it comes with its own memory). Also, the system
might need a higher bandwidth (i.e. more system time like what can come
from an FX card, PowerUp2 (not bad, I have one, but it works best in TC),
or an AfterBurner040 (ooh!)), but I'm not sure about that.
The higher the bit plane (1-bit plane is mono, 2-bit plane is 4 colour,
etc), the more memory that will be taken up. I have used 1024x960x2, and
have had more memory free than when I use 768x512x16. Anyone know the
memory requirements of 800x600xTC vs. 800x600x256? The screen will also
be faster, the lower the resolution and the lower the number of colours.
Feel free to send me mail if I can help you more.

Leslie

1787. Re: YET Another WARP 9 Question

Newsgroup: comp.sys.atari.st
Date: 1996-04-26 00:00:00 UTC
From: mcandrew.d.w@nort.bwi.wec.com
Message-ID: <DqGyBv.J0w@tron.bwi.wec.com>
Source record: 146166

A .DAT file is used to tell WARP 9 that the following named program is to inhibit WARP 9's operation. A sample DAT file included in the original distribution disks of WARp 9 allowed for the operation of CUBASE while temporarily turning the WARP 9 screensaver off. When CUBASE was terminated, then the operation of WARP 9's screensaver resumed full operational capability.

The FADE NOW/DON'T FADE corners mean that you can specify a corner of the screen to place the mouse cursor in, and it would either activate the screensaver immediately - or keep it from happening.

I cannot recall what the QSF file is for.

In article <4lgirg$d94@apollo.isisnet.com>, ae490@ccn.cs.dal.ca says...
>
>I'm baffled on what a .QSF file is! You see, I bought the program used

Select aud.track1, go to Monitor menu, click "monitor" on ch1, without closing
goto Hardware setup Mnu, it comes on top of Monitor window, push horizontal
sliders (A/D Vol) hard right and find out input Ch your mic is on by selecting
A/D Right or Left while monitoring levels. If that doesn't help, there's a
problem with connectors or cable. Keep your speaker's volume down, it may
feedback!

You did the right thing except for removing CBHD again 8-) Really,
since CBHD is faster than AHDI and is better in almost any respect,
I do not see a reason why you shouldn't be using it.

> Advice? What other programs can I use? Can I get hinstall to work?
> Can anyone explain how to use cbhd? I can't see the need for a

CBHD is not commercial; the configuration program is shareware (and
pretty cheap).

Hmmm... I guess we should finally have English docs for CBHD...

Sorry, S.Lai, you are wrong! I spoke to the boys @ Marpet when it was first launched but it was only available for the ST & STe _not_ MegaSTe - can't remember why, though!

1792. Re: Geneva/NeoDesk 4 don't like Papyrus/AtariWorks?

Newsgroup: comp.sys.atari.st
Date: 1996-04-26 00:00:00 UTC
From: iwb@cix.compulink.co.uk
Message-ID: <DqHE3B.5I1@cix.compulink.co.uk>
Source record: 146171

Christian,

Sorry to break in on this thread but I couldn't pass up the opportunity of speaking to the author of Papyrus directly!

Firstly, thanks for a GREAT program!

Secondly, and the reason for butting in, I have had some consistent problems with Papyrus and the STraight FAX! drivers. I've tried to get a response from Charles Smeton (and HiSoft), but to no avail, so perhaps you can shed some light on this?

I have been unable to upgrade from v3.57 to v3.64 because of the use I make of Papyrus to produce faxes.

I have also been unable to make use of Charles' STraight FAX! printer drivers and module.

The facts are these:

From within v3.57 I can print great faxes using the SpeedoGDOS STraight FAX! driver @ driver 22. If I try and use the Papyrus STraight FAX! driver I get an alert which says:
"Part of the page lies outside the printable area for this printer (top -2367677mm, bottom 6mm) and may not be printed" [Cancel] [CONTINUE]

If you [Continue] then a blank page is generated.

From within v3.64, if I try and use GDOS printer 22 (as above) I get an alert which says:
"The document almost disappears in the printer margins! Labels and other smaller formats should be printed on fanfold paper" [CANCEL] [Continue]

If you [Continue] the "printing" dialog flashes on the screen and no file is generated.

From within v3.64, if I try and use the STraight FAX! driver, the following alert appears:
"Part of the page lies outside the printable area for this printer (top -2367677mm, bottom 0mm) and may not be printed" [Cancel] [CONTINUE]

If you [Continue] then the following alert appears:
"The document almost disappears in the printer margins! Labels and other smaller formats should be printed on fanfold paper" [CANCEL] [Continue]

Continuing is the same as for GDOS driver 22.

So, I am back to v3.57 and eagerly awaiting v4 in English. But, in the meantime, if you have a solution, I'd be *very* interested.

Yep, thats how I know. :)

>comes with one), but the way I was led to believe, if your system has
>enough memory, and you can determine the right vertical and horizontal
>frequency for your monitor to achieve 800x600xTC, it is possible

Well, the highest I have gone (in VGA) is 600x480xTC. The problem
is not the monitor, but the Falcons bus. When the screen is displayed
on the monitor, the picture must be sent down the bus to the video
hardware. The bigger the screen/ more colours, the more has to be
sent.

Unfortunately, the Falcons bus is not very fast, and cannot cope with
the quantities of data required for 800x600xTC at 60Hz (or whatever, on
a VGA). RGB/TV is able to avoid this problem with interlacing, because
only half of the screen is sent every frame, the demands are far lower.

800x600xTC is probably possible (I haven't tried) but the frame-rate
would be so low it would be painful to look at the screen for any`

length of time...

>(personally, I'd recommend the Nova card for the Falcon which allows you
>to have 1024x960xTC, and it comes with its own memory). Also, the system

'its own memory' is the reason it can do this resolution...

>might need a higher bandwidth (i.e. more system time like what can come
>from an FX card, PowerUp2 (not bad, I have one, but it works best in TC),

Yes, this is needed for higher resolutions. A standard Falcon *can* be
pushed higher than 320x240xTCxVGA though...

>or an AfterBurner040 (ooh!)), but I'm not sure about that.
> The higher the bit plane (1-bit plane is mono, 2-bit plane is 4 colour,
>etc), the more memory that will be taken up. I have used 1024x960x2, and

That'd be 1024x960x1/8 = 122880 bytes screen memory...

>have had more memory free than when I use 768x512x16. Anyone know the

?? Strange, that should be: 768x960x4/8=368640 bytes of screen memory...

>memory requirements of 800x600xTC vs. 800x600x256? The screen will also

(TC) 800x600x16/8= 960000 bytes
(256) 800x600x8/8 = 480000 bytes.

>be faster, the lower the resolution and the lower the number of colours.

correct - there will be less on the bus, and so the whole system will
perform better.

hope this helps...
